NOTE

This manual documents the Model 8922A True RMS Voltmeter and its assemblies at the revision levels shown in Appendix 7A, Table 7A-1. If your instrument contains assemblies with different revision letters it will be necessary to either update or backdate this manual. Refer to the supplemental change/errata sheet for newer assemblies or to the backdating sheet (Appendix 7A) for older assemblies.

For the benefit and convenience of its customers, Fluke Corporation (Fluke) has reproduced this copy of a manual which is no longer in production. This manual has not been edited or updated since the revision date shown on the lower left hand corner of the first page. Fluke will not be liable for any claims, losses or damages of any kind incurred by any user arising from use of this manual.

8922A True RMS Voltmeter

Instruction Manual

P/N 522052 June 1979

LIMITED WARRANTY & LIMITATION OF LIABILITY

Each Fluke product is warranted to be free from defects in material and workmanship under normal use and service. The warranty period is one year and begins on the date of shipment. Parts, product repairs and services are warranted for 90 days. This warranty extends only to the original buyer or end-user customer of a Fluke authorized reseller, and does not apply to fuses, disposable batteries or to any product which, in Fluke's opinion, has been misused, altered, neglected or damaged by accident or abnormal conditions of operation or handling. Fluke warrants that software will operate substantially in accordance with its functional specifications for 90 days and that it has been properly recorded on non-defective media. Fluke does not warrant that software will be error free or operate without interruption.

Fluke authorized resellers shall extend this warranty on new and unused products to end-user customers only but have no authority to extend a greater or different warranty on behalf of Fluke. Warranty support is available if product is purchased through a Fluke authorized sales outlet or Buyer has paid the applicable international price. Fluke reserves the right to invoice Buyer for importation costs of repair/replacement parts when product purchased in one country is submitted for repair in another country.

Fluke's warranty obligation is limited, at Fluke's option, to refund of the purchase price, free of charge repair, or replacement of a defective product which is returned to a Fluke authorized service center within the warranty period.

To obtain warranty service, contact your nearest Fluke authorized service center or send the product, with a description of the difficulty, postage and insurance prepaid (FOB Destination), to the nearest Fluke authorized service center. Fluke assumes no risk for damage in transit. Following warranty repair, the product will be returned to Buyer, transportation prepaid (FOB Destination). If Fluke determines that the failure was caused by misuse, alteration, accident or abnormal condition of operation or handling, Fluke will provide an estimate of repair costs and obtain authorization before commencing the work. Following repair, the product will be returned to the Buyer transportation prepaid and the Buyer will be billed for the repair and return transportation charges (FOB Shipping Point).

THIS WARRANTY IS BUYER'S SOLE AND EXCLUSIVE REMEDY AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. FLUKE SHALL NOT BE LIABLE FOR ANY SPECIAL, INDIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES OR LOSSES, INCLUDING LOSS OF DATA, WHETHER ARISING FROM BREACH OF WARRANTY OR BASED ON CONTRACT, TORT, RELIANCE OR ANY OTHER THEORY.

Since some countries or states do not allow limitation of the term of an implied warranty, or exclusion or limitation of incidental or consequential damages, the limitations and exclusions of this warranty may not apply to every buyer. If any provision of this Warranty is held invalid or unenforceable by a court of competent jurisdiction, such holding will not affect the validity or enforceability of any other provision.

Fluke Corporation P.O. Box 9090 Everett WA 98206-9090 Fluke Europe B.V. P.O. Box 1186 5602 B.D. Eindhoven The Netherlands

8922A True RMS Voltmeter

Section 1

Introduction & Specifications

1-1. INTRODUCTION

- 1-2. The Model 8922A is a Digital True RMS Voltmeter, capable of accurately measuring the true rms value of nonsinusoidal signals containing AC or AC + DC components. The instrument has a frequency range of 10 Hz to 11 MHz with a full-scale crest factor of seven, and is capable of displaying measurements in either volts or dB units.
- 1-3. Selecting the VOLTS position on the dB/VOLTs switch enables the volts display mode and two applicable front panel annunciators (V, mV). In this mode, the instrument displays up to a $3\frac{1}{2}$ digit figure to indicate the true rms value of any AC or AC + DC input signal whose amplitude is between $180 \, \mu V$ and $700V \, rms (1000V \, peak)$.
- 1-4. The dB display mode (logarithmic) is enabled when dB is selected on the front panel dB/VOLTS display switch. In this mode, the instrument displays up to a 41/2 digit dBm value of the input signal referenced to one-oftwelve manually selected impedances (50 to 1200 ohms). The dB display mode also uses two annunciators - dB and RELATIVE REFERENCE -- and to establish the instrument's operating status. The RELATIVE REFERENCE annunciator lights whenever the REL switch is depressed to indicate that any further dB measurements will be referenced to the voltage present at the time the switch was pressed. An UNCAL annunciator lights with both display modes when internal protection circuits are energized. When AUTO is selected on the AUTO/HOLD switch (the out position) the autorange mode selects one-of-seven input ranges to optimize the display resolution.
- 1-5. Complementing the instrument's high digital resolution is an analog panel meter for use in applications that require peaking or nulling. This meter does not have

calibration markings since it is intended for peaking and nulling indications only.

- 1-6. Note that the 8922A accomodates floating measurements up to approximately 0.6V peak with respect to earth ground. Isolation of 0.6V peak will accomodate the few hundred millivolts of typical common mode voltage. Full operator protection is maintained since under fault conditions the diode isolation circuitry conducts to insure that the common mode voltage is never greater than one diode drop.
- 1-7. Several options and accessories are available for use with the 8922A. The options and accessories are listed and described in Table 1-1. They may be ordered for factory or field installation. Detailed information concerning each option and accessory is given is Section 6 of this manual.

1-8. The PTI (Portable Test Instrument) case is a family of injection molded, plastic instrument packages of various sizes which may be stacked vertically and latched together to form portable test stations. When instruments are stacked the weight of the stack should be limited to 40 pounds total, and the instrument drawing the most power should be on the top. Stacked instruments have a

horizontal air space between them to reduce heat conduction between instruments.

1-9. SPECIFICATIONS

1-10. Detailed specifications for the Model 8922A True RMS Voltmeter are given in Table 1-2. Specifications for the Model 8922A options are given in Table 1-3.

Table 1-2. Specifications

			/- · \
ELE	CTR	ICAL	(Basic)

The electrical specifications given assume an operating temperature of 23° C $\pm 5^{\circ}$ C, relative humidity up to 80% and a minimum 90 day calibration cycle.

FUNCTIONS:

AC true rms, AC + DC true rms (with 2 Hz damping for improved

low frequency performance).

DISPLAYS:

Digital Display, Panel selectable for volts or dB.

Analog peaking/nulling meter.

RANGING:

Autoranging, HOLD to defeat Autoranging, STEP-UP for manual $\,$

up-ranging. Ranges up at 2000 counts. Ranges down at 180 counts.

LOW PASS FILTER:

200 kHz Low Pass Filter.

MAXIMUM INPUT:

700V rms or 1000V peak, not to exceed 1 X 108 volts-Hz

product on any range.

RESPONSE TYPE:

True rms thermal converter will accept: sine, complex, pulse,

or random waveforms.

RESPONSE TIME:

AC:

1.6 seconds typically to rated accuracy within a range, composed

of 1 second settling time and 0.6 seconds macimum digitizing

time.

AC + DC:

7 seconds maximum to rated accuracy within a range, composed

of 5 seconds settling time and 2 seconds maximum digitizing

time.

INPUT IMPEDANCE:

2 mV to 700V range = 10 M Ω /shunted by <30 pF.

CREST FACTOR:

7 at full-scale, increasing proportionately as percent of scale decreases. See the Crest Factor portion of the Input Signal

Considerations in Section 2.

FREQUENCY RANGE:

2 mV - 20 V range = 2 Hz to 11 MHz

200V - 700V range = 2 Hz to 1 MHz

ELECTRICAL (VOLTS Display Mode)

RANGES:

2 mV, 20 mV, 200 mV, 2V, 20V, 200V, and 700V.

RESOLUTION:

0.05% of range. (3½ digits).

Table 1-2. Specifications (cont)

ELECTRICAL (dB Display Mode)

dB RANGE:

In the autorange mode the instrument appears as though it has a single range spanning 132 dB. Transients will appear in the readout as the transition through which the analog voltage range

points occur.

dB RANGE REFERENCES:

dBm REFERENCES:

Twelve manually selectable impedances with which to

reference a 0 dBm, 1mW signal level. Impedances are 50, 75, 93,

110, 124, 135, 150, 300, 600, 900, 1000 and 1200 ohms.

RELATIVE dB REFERENCE:

A voltage present when this switch is depressed to its REL position is held as 0 dB reference for all other voltages.

dB RESOLUTION:

0.01 dB (41/2 digits).

ACCURACY:

The accuracy specifications given below apply to the volts and dB display modes at 9% to 100% of full-scale, 23° C $\pm 5^{\circ}$ C, 90 day. For

6 month specifications, multiply all values by 1.5.

8922A Voltmeter Specifications 23°C ±5°C, 90 Days

INPUT VOLTAGE	RANGE	2 Hz 10					ADING OR		Hz 11 MHz
180-700V 18.0-199.9V	700V 200V		FILTE 5% or	ERIN			FILTE	R OUT Not Sp	ecified

AC + DC ACCURACY
(USE 50 Hz - 10 kHz SPEC FOR DC ONLY)

ADD TO AC SPECIFICATION:

±10 Digits or 0.5 dB Above 2 mV. ±100 Digits or 5 dB Below 2 mV.

*Valid When AC + DC (Damping) is Selected and Input is AC Only.

Below 2 mV add: $\frac{5}{\text{mV Input}}$ digits or $\frac{0.05}{(\text{mV Input})^2}$ dB

Table 1-2. Specifications (cont)

TEMPERATURE COEFFICIENTS at 0°C to 18°C, 28°C to 50°C (32 to 64.4°F, 82.4 to 122°F)

FUNCTION

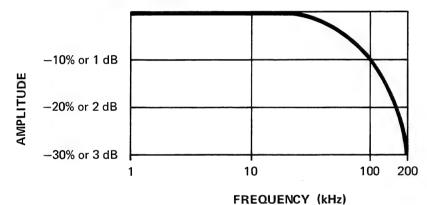

AC

2 Hz 1 N	IHz 11 MHz
0.07%/°C or 0.006 dB/°C	0.1%/°C or 0.01 dB/°C

AC + DC

INPUT	ABOVE 2 mV	BELOW 2 mV
AC + DC	±(2 digits/°C or 0.1 dB/°C)	±(20 digits/°C or 1.0 dB/°C)
AC	Same as AC Function	$+ \frac{2 \text{ digits}}{\text{mV input}} $

LOW PASS FILTER RESPONSE (Typical)

GENERAL

INPUT:

Isolated BNC input floating up to .6V peak.

DISPLAYS:

5 (0.3" high) digit, 7-segment LED's with automatic decimal point location and mV, V, dB, RELATIVE REFERENCE, and UNCAL annunciators. The display also incorporates an uncalibrated

analog meter for nulling and peaking.

AUTORANGING RATE:

VOLTS:

AC 700 ms max/range change; 2.2 sec max for 6 range changes. AC + DC 2.5 sec ac max/range change; 10 sec max for 6 range

changes.

dB:

AC 950 ms max/range change; 2.9 sec max for 6 range changes. AC + DC 3.5 sec max/range change; 13 sec max for 6 range changes.

READING RATE:

AC 2.5 readings per second. AC + DC 1 reading per second.

OVERRANGE INDICATION:

Flashes maximum allowed reading for that range.

UNDERRANGE INDICATION:

Flashes decimal point, but continues to display the reading.

Table 1-2. Specifications (cont)

GENERAL (cont):

UNCAL INDICATION:

Illuminates to indicate crest factor is exceeded.

MAXIMUM COMMON MODE:

VOLTAGE:

400 mV rms or 600 mV peak, diode clamped.

INPUT COMMON MODE:

REJECTION:

> 80 dB @ 50 or 60 Hz (with 100 ohms in either lead).

LINEAR ANALOG OUTPUT:

Each range provides a linear output with 2V dc equal to 2000 counts on the readout, $\pm 1.0\%$ of reading relative to display; essentially 0 ohm output resistance into a $> 10~\mathrm{k}\Omega$ load; non-isolated with output common the same as input common.

STORAGE TEMPERATURE:

-40°C to +75°C.

OPERATING TEMPERATURE:

0°C to 50°C.

HUMIDITY RANGE:

80% RH.

MTBF:

Greater than 10.000 hours.

POWER:

100V ac ±10%, 120V ac ±10%, 220V ac ±10%, or 240V ac

±10% to 250V ac max. selected by internal switches, 45 to 440 Hz,

10 W max.

DIMENSIONS:

32.7 cm (12.9 in.) L X 20.3 cm (8.0 in.) W X 10.8 cm (4.3 in.) H.

WEIGHT:

2.47 kg (5 lb. 7 oz.).

Table 1-3. Specifications for 8922A Options

OPTION -003, COUNTER OUTPUT OPTION

OUTPUT VOLTAGE:

100 mV peak square wave.

OUTPUT IMPEDANCE:

50 ohms.

MAXIMUM ISOLATED LEVEL:

Maintains instrument isolation with respect to earth ground.

OPTION -004, LOGARITHMIC ANALOG

OUTPUT OPTION

OUTPUT VOLTAGE DC:

200 μ V rms input = 0 dB, 0V dc out.

700V rms input = 131 dB, 13.1V dc out.

i.e., 100 mV = 1 dB.

Non-isolated, output common is the same as input common.

LINEARITY:

Within each range: ±0.35 dB. Over all seven ranges: ±2 dB.

OUTPUT IMPEDANCE:

1 k Ω .

OPTION -521 DMM DIGITAL INTERFACE

DESCRIPTION:

Serial BCD output of all digits and annunciators.

OPTICAL ISOLATION:

Transfer reliable up to 500V ac rms common mode from dc to

440 Hz.

OPERATING POWER:

From DMM +5V and GND

From external device +5V at less than 10 mA and GND.

OPTION -529 DMM-IEEE-488 INTERFACE

DESCRIPTION:

Option for interfacing the 8922A to IEEE 488-1978. Package consists of one pcb mounted in the 8922A, one pcb mounted in the 1120A Translator and one interconnect cable. The 1120A must be

used to interface to the IEEE 488 General Purpose Bus.

FUNCTION:

Talker.

IEEE REPERTOIRE

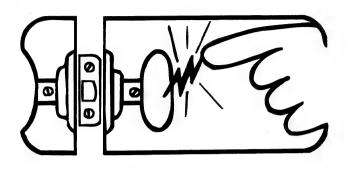

SH1, AH1, T3, TE3.

static awareness

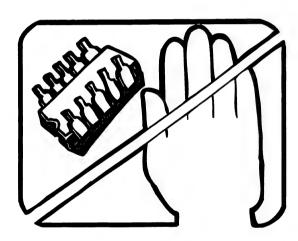

A Message From Fluke Corporation

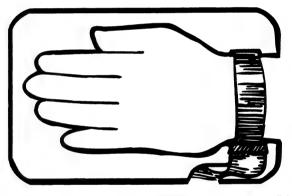

Some semiconductors and custom IC's can be damaged by electrostatic discharge during handling. This notice explains how you can minimize the chances of destroying such devices by:

- 1. Knowing that there is a problem.
- 2. Leaning the guidelines for handling them.
- 3. Using the procedures, packaging, and bench techniques that are recommended.

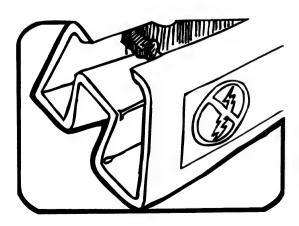

The following practices should be followed to minimize damage to S.S. (static sensitive) devices.

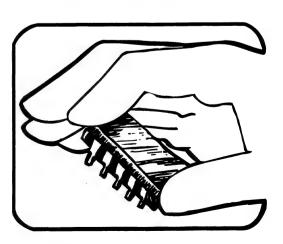

1. MINIMIZE HANDLING

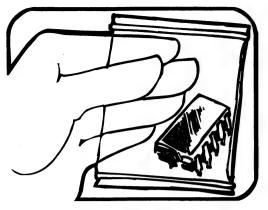

3. DISCHARGE PERSONAL STATIC BEFORE HANDLING DEVICES. USE A HIGH RESISTANCE GROUNDING WRIST STRAP.

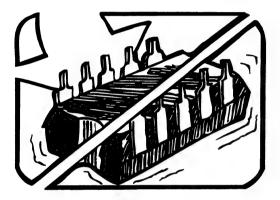

2. KEEP PARTS IN ORIGINAL CONTAINERS UNTIL READY FOR USE.

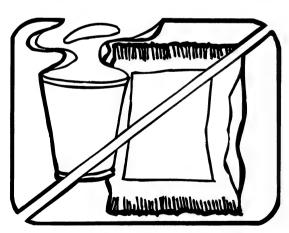

4. HANDLE S.S. DEVICES BY THE BODY.

5. USE STATIC SHIELDING CONTAINERS FOR HANDLING AND TRANSPORT.

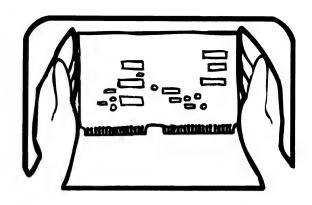

6. DO NOT SLIDE S.S. DEVICES OVER ANY SURFACE.

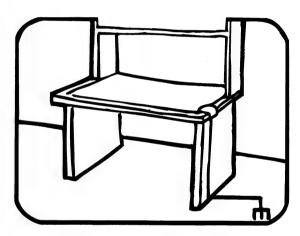

7. AVOID PLASTIC, VINYL AND STYROFOAM® IN WORK AREA.

PORTIONS REPRINTED
WITH PERMISSION FROM TEKTRONIX INC.
AND GENERAL DYNAMICS, POMONA DIV.

8. WHEN REMOVING PLUG-IN ASSEMBLIES HANDLE ONLY BY NON-CONDUCTIVE EDGES AND NEVER TOUCH OPEN EDGE CONNECTOR EXCEPT AT STATIC-FREE WORK STATION. PLACING SHORTING STRIPS ON EDGE CONNECTOR HELPS PROTECT INSTALLED S.S. DEVICES.

- HANDLE S.S. DEVICES ONLY AT A STATIC-FREE WORK STATION.
- 10. ONLY ANTI-STATIC TYPE SOLDER-SUCKERS SHOULD BE USED.
- 11. ONLY GROUNDED-TIP SOLDERING IRONS SHOULD BE USED.

Section 2

Operating Instructions

2-1. INTRODUCTION

2-2. The information we have presented in this section is intended to familiarize you with the capabilities and limitations of the Model 8922A. We have included instructions for the installation and operation of your 8922A as well as a brief description and identification of each control and indicator on the instrument.

2-3. SHIPPING INFORMATION

- 2-4. The Model 8922A is packaged and shipped in a protective container. When you receive the equipment, make a thorough inspection for any possible shipping damage. If your 8922A was damaged in shipment contact your nearest John Fluke Service Center immediately. A list of these service centers may be found in Section 7.
- 2-5. If reshipment of the instrument is necessary, use the original container. If the original container is not available, a new one may be obtained from the John Fluke Mfg. Co., Inc. Please indicate the instrument's model number (8922A) when requesting a new shipping container.

2-6. INSTALLATION

2-7. The 8922A is designed for bench-top use, for installation in a standard 19-inch equipment rack, or for panel mounting into any DIN size opening. Available rack mounting kits are listed in Table 1-2. In bench-top environments the 8922A may be stacked with other Fluke products that use the PTI case. To connect two or more PTI cases, pull the side connectors out, place one case squarely on top of another and press in on the side connectors of the top case until they seat firmly into the slots on the case below. See Figure 2-1.

CAUTION

Before you attempt to lift a series of stacked instruments, check each unit to ensure that its case connectors are properly mated and latched to the next lower instrument.

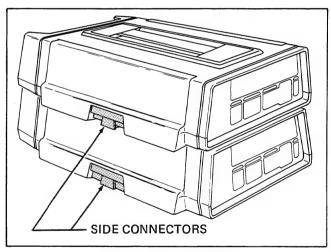

Figure 2-1. PTI Connection

2-8. INPUT POWER

2-9. The 8922A can be operated from one of several line voltages: 120, 100, 220, or 240V. Refer to the procedure in Section 4 to alter the line power configuration of the instrument. We recommend that this procedure be performed by qualified personnel only.

2-10. CONTROLS AND INDICATORS

2-11. The 8922A controls, indicators, and connectors are shown in Figure 2-2 and described in Table 2-1. Locate each feature on your DMM as you read the description.

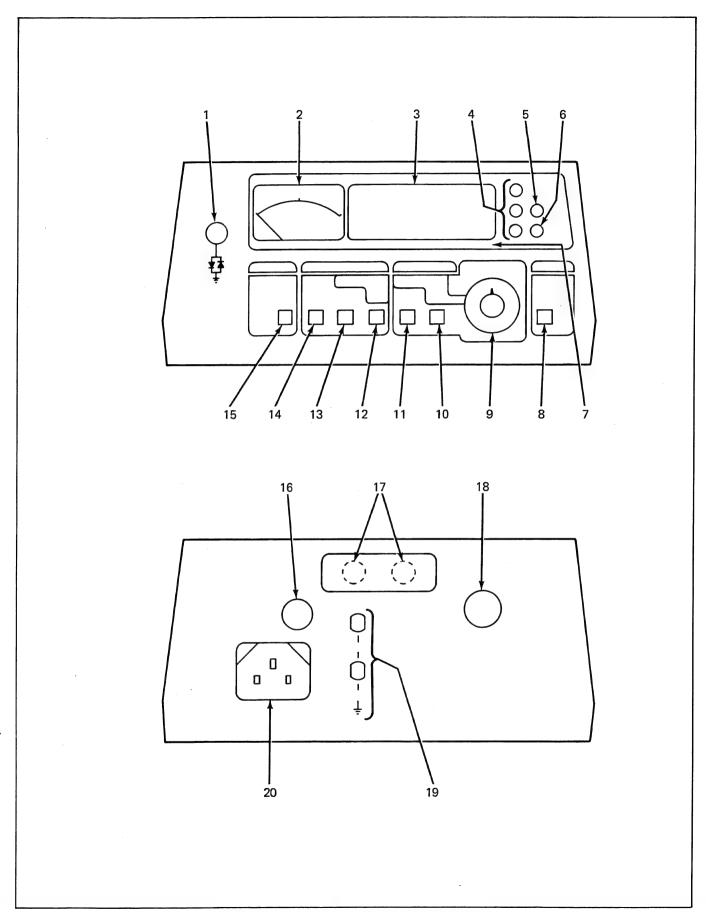

Figure 2-2. Controls, Indicators, and Connectors

Table 2-1. Controls, Indicators, and Connectors (cont)

REF NO.	NAME	FUNCTION
1	INPUT	A BNC input connector. The low side is isolated from power ground through a pair of parallel diodes.
2	Analog Panel Meter	Uncalibrated panel meter provides analog tracking of input level; useful for peaking and nulling indications.
3	Digital Display	LED display provides a direct readout of the input signal level; includes decimal point and polarity.
4	Annuniciators	LED's that light to indicate the selected measurement function V (volts), mV (millivolts) or dB (decibels).
5	UNCAL	An LED that light to indicate that the instrument's internal protection circuitry is energized, see Crest Factor, under operating instructions.
6	RELATIVE REFERENCE	An LED that lights to indicate that the voltmeter is in the dB display mode and using a relative voltage reference.
7	2/20/200/700	Indicate DMM range by decimal point locations.
8	POWER Switch	A push-push switch used to turn the instrument ON (in) and OFF (out).
9	dBm REFERENCE	Rotary switch used to manually select 1-of-12 reference impedances when the dBm and dB display modes are selected.
10	REL/dBm	A push-push switch used to select either the relative dB or the dBm display mode. When REL is depressed, the existing input level is used to establish a 0 dB reference. Subsequent level changes at the input are displayed in dB and referenced to the operator established 0 dB level. When dBm is selected, measurements are displayed in terms of dBm and the dBm REFERENCE setting.
11	dB/VOLTS	A push-push switch used to select either the voltage (out) or dB (in) display mode.
12	STEP UP	A momentary pushbutton switch used to incrementally step the voltmeter to its higher range. This switch is enabled only when the HOLD RANGE mode is selected.
13	HOLD/AUTO	A push-push switch used to select the manual (HOLD) or autorange (AUTO) mode. Selecting HOLD (in) enables manual upranging with the STEP UP switch. Selecting AUTO (out) enables the unit to autorange.
14	FILTER	A push-push switch which, when depressed, engages a single pole filter to reject unwanted high frequency signals. See the Specifications table for effect on accuracy.
15	AC/AC + DC (damping)	A push-push switch used to include (in) or delete (out) dc components as part of the input signal level. When AC + DC is selected (in) damping increases which extends low frequency operation down to 2 Hz. Reading and ranging rates are slower.
16	F1	Line fuse, MDL $1/8A$ slo-blo.(5×20 mm, $1/8A$, slow acting for metric.)

Table 2-1. Controls, Indicators, and Connectors (cont)

REF. NO.	NAME	FUNCTION
17	DIGITAL OUTPUT/ LOG-ANALOG OUTPUT	An output port reserved for use with the Logarithmic Output Option-004-521 Option, or the -529 IEEE Interface Option, see Section 6 for details.
18	COUNTER OUTPUT	An output port reserved for use with the Counter Output Option -003. See Section 6 for details.
19	Linear Analog	A pair of banana jacks for output accessing the dc linear analog output voltage. This voltage is proportional to the V rms input and is linearly scaled; 2V dc out equals a 2000 count readout. The scale repeats for each range.
20	Input Power Connector	A 3-prong line power connector for connecting the unit to line power.

2-12. OPERATING NOTES

2-13. The following paragraphs describe various conditions which you should be aware of before attempting to operate the 8922A.

2-14. Fuse Replacement

2-15. The Model 8922A is fuse protected from the power line. You can access the fuse by pressing and turning (CCW) the fuse cap located on the rear panel. When replacement is necessary use an MDL type 1/8 amp slo-blo fuse for all voltage configurations. (For metric fuse, use 1/8A, slow acting, 5 x 20 mm glass tube type.)

2-16. Display Indications

- 2-17. In addition to the standard digital readout, we have equipped the front panel display with a series of unique visual indicators. These include an overrange/overload indication, an underrange indication, and an analog meter. They function automatically to help you make error free measurements.
- 2-18. For example, when an input signal level exceeds the display limit for the selected range an overrange will occur. The display digits flash while the overrange is present. Selecting a higher range will eliminate the overrange condition.
- 2-19. Measurement accuracy is uncertain when the higher voltage ranges are used to measure low level signals. To alert you to this condition, the decimal point will flash when the input is too low for the selected range (less than 180 digits). You may eliminate this underrange indication by manually selecting a lower range or selecting autorange.

2-20. The uncalibrated analog panel meter complements the digital display by linearly tracking the input signal level. It provides a 0-to-100%-of-scale indication for the selected range. This feature will aid you in detecting the peak and null points of inputs having varying levels.

2-21. Measurement Connections

2-22. COAX OR OPEN LEADS

2-23. We recommend that shielded or coax leads be used at the input for low level or high frequency measurements. Open leads (unshielded) may pick up interference from other sources causing errors at low levels. You may reduce high frequency errors by minimizing inductance and capacitance between the source and the 8922A input connector.

2-24. SAFETY CONSIDERATIONS

- 2-25. Under normal operating conditions, the 8922A will not present a potential electrical shock hazard to the operator. However, careless use of input-lead connectors and/or adapters may create a shock hazard.
- 2-26. The low input on the 8922A is connected to power ground through a pair of diodes (see front panel connector). These diodes allow the low input terminal to float up to 400 mV rms. Their function is twofold; they provide isolation between input low and power ground, and they protect the operator from the possibility of hazardous voltages existing on the exposed low input connector.
- 2-27. At first glance, 400 mV of isolation does not appear significant. However, in most cases it provides

enough isolation to prevent ground loop currents and, therefore, measurement errors due to ground loops.

2-28. When you connect the low input of the 8922A to a potential greater than 400 mV above power ground, the diode pair conducts and effectively clamps the input common mode voltage.

WARNING

TO AVOID ELECTRICAL SHOCK HAZARD DO NOT REMOVE OR OTHERWISE DEFEAT THE INPUT DIODE PAIR.

2-29. Under no circumstances should you attempt to defeat the function of the diodes. Specifically, the diodes should not be removed, the ground return on the power cord should not be floated, and an isolation transformer should not be used to power the 8922A. If the diodes are defeated, a shock hazard will exist at the low input connector when the low input lead is floated above 30 volts.

2-30. IMPEDANCE MATCHING

- 2-31. Two types of ac voltage measurements are typically made; those involving matched impedance systems and those where voltmeter loading is minimized (high impedance measurements) and no impedance matching occurs.
- 2-32. When matched impedance systems are measured, the input cable should be terminated as close as possible to the 8922A input, thereby minimizing input capacitance and enhancing accuracy at high frequencies. This is accomplished by including the meter as an integral part of the circuit as shown in Figure 2-3A. Notice that the integrity of the 50Ω system is maintained by using a 50Ω broadband matching power splitter. An alternate solution is shown in Figure 2-3B. In this case, the source is alternately connected to the 8922A and the test circuit. This allows the source to be adjusted to a known level before being connected to the test circuit. Since both the meter and the test circuit are 50Ω loads the circuit integrity is maintained. In either method, the accuracy will be determined in part by the accuracy of the source impedance and the accuracy of the termination.
- 2-33. High impedance measurements are based on the assumption that the voltmeter's fixed 10 M Ω input resistance and low input capacitance will not appreciably load or otherwise affect the circuit being measured. If the measurement frequency is low, this assumption holds true.

2-34. COMMON MODE VOLTAGE MEASUREMENTS

2-35. The 8922A will accommodate common mode voltages as high as 600 mV peak, usually enough to eliminate ground loops in the power connections. Higher common mode voltages will be clamped to 600 mV up to a 25 amp maximum load capability.

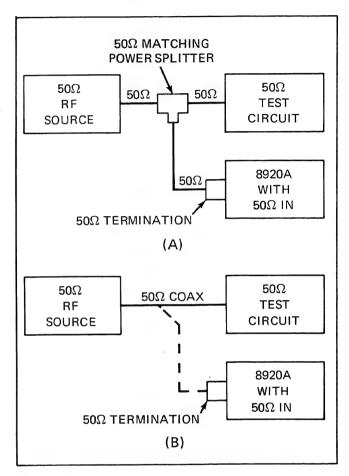

Figure 2-3. Matched Impedance Measurement Techniques

2-36. Input Signal Considerations

2-37. The 8922A is a true rms voltmeter, and as such, is subject to input conditions not encountered with the ordinary average-reading ac voltmeter. Of these, the two most important are crest factor and input coupling.

2-38. CREST FACTOR

2-39. Crest factor is the ratio of the peak voltage to the rms voltage with the dc component removed. Above 10 Hz, the crest factor is limited by the dynamic range of the amplifiers. Crest factor capability in this frequency range will be at least 7 for full-scale inputs and will increase

proportionally as the input goes down-scale. Use the following formula to calculate the crest factor of signals less than full-scale:

Crest Factor =
$$\frac{7 \text{ (Range)}}{\text{Input Level}}$$

For example, given the DMM is at the 20V range with a 10V input:

Crest Factor =
$$\frac{> (20V)}{10V} = \frac{140V}{10V} = 14$$

2-40 Below 10 Hz, crest factor is limited by the time required for the internal rms sensor protection circuit to energize and limit the sensor temperture. Typical low frequency crest factor limitation is shown in Figure 2-4. When the protection circuit does not energize, the UNCAL annunciator will light indicating that the protection circuit is introducing measurement errors. When this occurs, manually selecting a higher range may produce a better measurement.

2-41. INPUT COUPLING, AC/DC

2-42. The 8922A is equipped with a FUNCTION switch which allows you to select either AC or AC + DC coupling. When the switch is out, AC coupling is selected. In this function the dc component is removed from the input signal and is not measured or displayed. Depressing the FUNCTION switch selects AC + DC coupling. This function allows the 8922A to measure and display the true rms value for the total input signal; ac components and dc components. You should always consider the dc component when power dissipation is being determined. This function also increases the damping which is

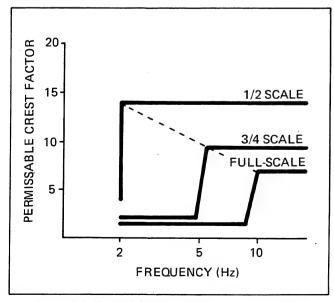

Figure 2-4. Typical 8922A Crest Factor Limitation

required for good performance below 10 Hz. This additional damping may also aid in the measurement of higher frequency signals when the level of the signal fluctuates.

2-43. Range Selection

- 2-44. Seven voltage ranges, and what appears to be a single dB range spanning 132 dB are provided in the instrument. Range selection is normally accomplished automatically. Override switches, however, allow you to interrupt the autorange function and manually increment the range.
- 2-45. The autorange function optimizes the display reading for a given input. Each reading is displayed complete with decimal point and units' annunciator. The individual ranges are directly defined for the operator by labeled decimal points. Underrange (flashing decimal point) and overrange (flashing digits) indications are provided to indicate when a range change is necessary.

2-46. AUTORANGE

2-47. The proper measurement range is automatically selected when the HOLD/AUTO switch is in the AUTO (out) position. Both decimal point and units' annunciator change automatically with range.

2-48. MANUAL

2-49. Manual range determination is accomplished by selecting a range using the autorange mode and then depressing the HOLD/AUTO switch. The meter will stay in that range regardless of input level changes. If the range becomes invalid for a given input level, an overrange or underrange indication will flash. If an underrange is indicated, select autorange (AUTO). After the proper range is selected, press HOLD. For overrange conditions, momentarily press the STEP UP switch once for each desired range increment. Holding the switch in will increment the meter to the 700V range. Select autorange (AUTO) to downrange.

2-50. Voltage Display Mode

- 2-51. The 8922A will display a voltage input in one-oftwo measurement units; volts or dB. To display the input voltage in units of volts, you must set the dB/VOLTS switch to VOLTS. The instrument will now display all input in units of volts or millivolts, as indicated by the front panel annunciators (V), (mV).
- 2-52. Two points of interest about the volts display mode are as follows: one, if the input is completely unknown, allow the autoranging circuit to select the appropriate range. Two, the selection of the volts display

mode will not affect any previous reference established in the dB display mode (see following paragraphs for additional information about establishing a dB reference).

2-53. dB Display Mode

- 2-54. When the instrument is in its dB display mode, all voltage inputs are referenced to a selected level, and displayed as deviations (in dB) above or below that level. If you wish to display the input voltage in dB units, set the dB/VOLTS switch to dB. The instrument's front panel dB annunciator will now light, indicating to you that the display is presenting a measurement in dB units.
- 2-55. The instrument references all inputs to a selected level. Before a meaningful measurement in dB units can be made, the desired reference level (0 dB) must be established. See RELATIVE REFERENCE Selection and dBm REFERENCE.

2-56. dBm Measurements

- 2-57. Measurements made to a fixed 1 milliwatt reference are defined as dBm. The 1 milliwatt reference is generally assumed, as indicated by m. However, the system impedance must be specified for a particular measurement. Once the impedance is selected, the instrument will display its measurements in dBm.
- 2-58. The 8922A is equipped with a rotary switch called dBm REFERENCE (Ω). By setting the switch to 1-of-12 possible standard reference impedances (50Ω , 75Ω , 93Ω , 110Ω , 124Ω , 135Ω , 150Ω , 300Ω , 600Ω , 900Ω , 1000Ω , and 1200Ω) you establish that impedance as a reference. When the system impedance and the reference are the same, the display is in terms of dBm.

NOTE

If the 1000 ohm reference impedance is selected ("dBV" on the rotary switch), the 0 dB point will correspond to 1V.

2-59. dBm REFERENCE SELECTION

- 2-60. Use the following procedure to select a reference impedance and enable the dBm display mode:
 - 1. Depress the dB/VOLTS switch (in).
 - 2. Release the REL/dBm switch (out).
 - 3. Set the dBm REFERENCE (Ω) switch to correspond with the system impedance.

NOTE

The dBm REFERENCE switch does not affect the fixed 10 $M\Omega$ input impedance of the 8922A. All impedance matching terminations must be added externally by the operator.

2-61. Relative Measurements (REL)

- 2-62. This feature allows you to make any voltage input a "0 dB point" to which all other voltage inputs may be referenced. For measurements at a single test point, press the dB switch, then the REL switch and watch the dB change as you make adjustments or circuit changes.
- 2-63. A typical application for the dB measurement mode is shown in Figure 2-5. The relative reference (0 dB) has been established at TP2. Subsequent dB measurements at TP1, TP3, TP4, and TP5 are displayed (in dB) as shown.

2-64. RELATIVE REFERENCE SELECTION

- 2-65. Use the following procedure to enable the relative (REL) display mode and select a relative (0 dB) reference.
 - 1. Connect the reference source to the 8922A input terminals. If desired, measure and adjust the reference supply voltage level.
 - 2. Select the autorange mode (AUTO).
 - 3. Release the REL/dBm switch (out).
 - 4. Depress the dB/VOLTS switch (in).
 - 5. With the reference level still connected to the input terminals, depress the REL switch. The display should now read 0 dB and the RELATIVE REFERENCE annunciator should be lit.

2-66. OTHER dBm REFERENCES

- 2-67. When a dBm reference, other than those given on the dBm REFERENCE switch is required, use the following procedure to establish the reference:
 - 1. Define the reference impedance (R) and calculate V using the following formula:

V = 0.001 x R

2. Apply an adjustable voltage source to the 8922A input and set the dB/VOLTS switch to the VOLTS position. Adjust the voltage source for a display reading equal to the calculated value of V.

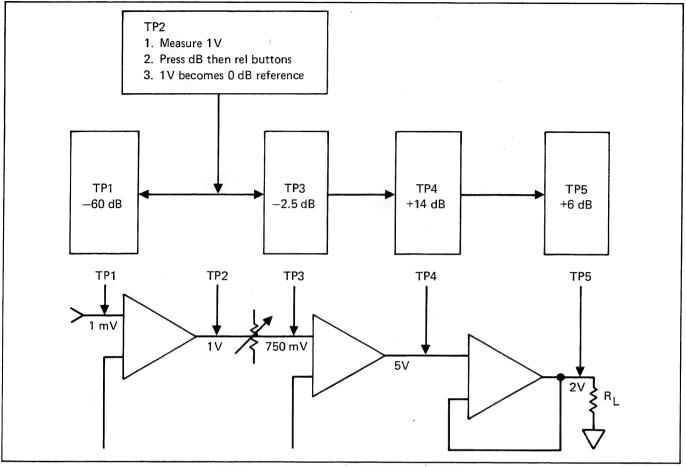

Figure 2-5. Typical Relative dB Measurements

- 3. Depress the dB/VOLTS switch (in).
- 4. Depress the REL/dBm switch (in). This establishes the voltage (V) as the 0 dB reference level. Therefore, subsequent dB measurements will be equivalent to dBm measurements as long as the system impedance R is maintained.

NOTE

This reference will hold as long as the REL/dBm switch is at the in position and the instrument is energized.

2-68. Linear Analog Output

2-69. A pair of banana jacks on the rear panel of the 8922A provides access to a linear dc analog output signal. This signal is proportional to the applied input signal and is linearly scaled; a 2V dc output is equal to 2000 counts on the display. Output accuracy is $\pm 1\%$ relative to the front panel reading. The output signal is buffered, and is suitable for driving an external analog meter, recorder, plotter, scope, etc.

2-70. OPERATION

2-71. With reference to the preceding paragraphs, use the following procedure to turn-on and operate the

Model 8922A (refer to Section 6 for option and accessory information):

- 1. Connect the 8922A to line power.
- 2. Set the front panel POWER switch to ON (in). The front panel display should light.
- 3. Select the appropriate input leads and connect them to the meter's input terminals. Add terminations as close as possible to the input connector, if impedance matching is required.
- 4. Select input coupling by setting the FUNCTION switch to AC (out) or AC + DC (in), as desired.
- 5. Select the desired range. Use automatic or manual method, as desired.
- 6. Set the DISPLAY switches to select the desired measurement mode: volts, dB, or dBm. If dB is selected, establish a 0 dB reference.
- 7. Observing safety considerations, connect the test leads to the measurement points. The results are displayed on the 8922A readout.

Section 3

Theory of Operation

3-1. INTRODUCTION

3-2. The information in this section describes the theory of operation for the 8922A True RMS Voltmeter. The theory has been divided into two major headings; overall functional description and detailed block diagram description. To gain maximum benefit from this section, we recommend that you read each paragraph in the order presented while referring to the associated figure or the appropriate schematic in Section 8.

3-3. OVERALL FUNCTIONAL DESCRIPTION

3-4. As you can see in Figure 3-1, the circuitry of the 8922A can be divided into two sections; analog and digital. An overall functional description of these two sections is presented in the following paragraphs.

3-5. Analog Circuitry

- 3-6. The analog section comprises the largest portion of the 8922A circuitry. As shown in Figure 3-1, this section is broken down into the following areas: the signal conditioner, the rms converter and the power supply.
- 3-7. Referring to Figure 3-2, you can see that the signal being measured by the 8922A can be coupled to the signal conditioner in one of two ways (AC or AC + DC). When you place the FUNCTION switch on the front panel to the AC position all input signals are capacitively coupled; when the AC + DC position is selected the input signal is dc, or directly coupled. This feature contributes to the measurement accuracy when dc components are present in the input signal.

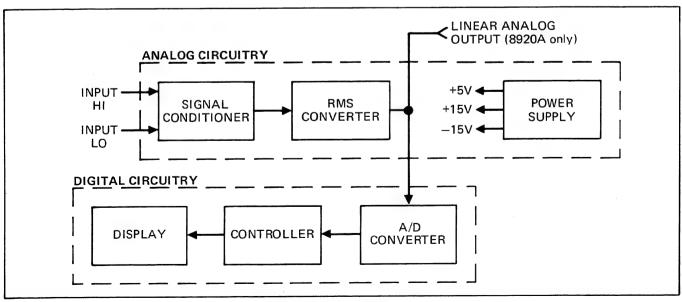

Figure 3-1. Overall Block Diagram

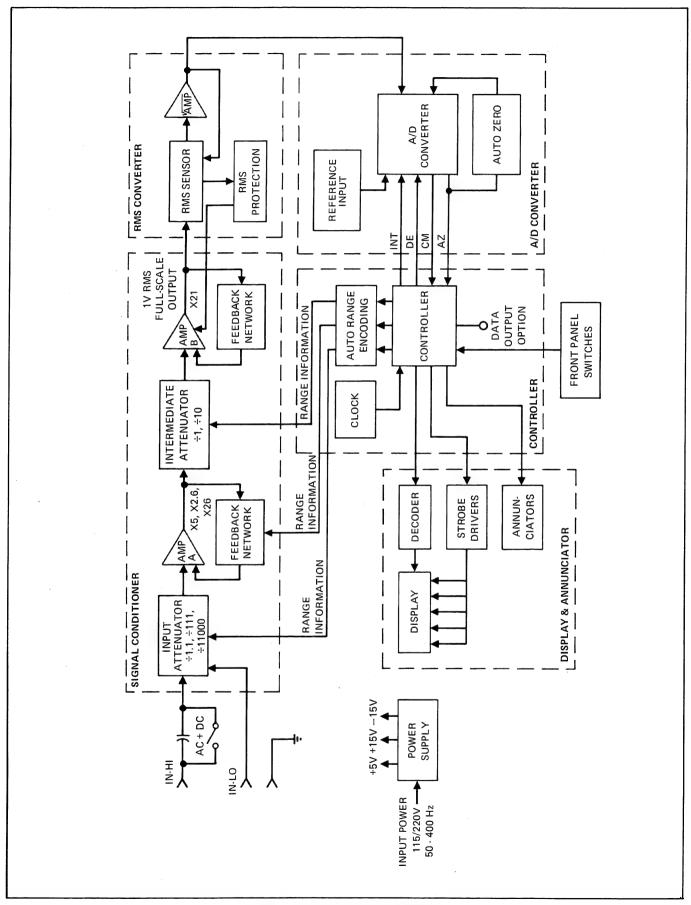

Figure 3-2. Detailed Block Diagram

- 3-8. The signal conditioner insures that the varying levels of instrument input voltages are properly scaled before being applied to the rms converter. The rms converter works on a thermal sensing principle. Basically, it operates by balancing the heating power of a dc feedback signal to the heating power of the ac input signal. When the two are equal, the circuit is in equilibrium and the dc output voltage applied to the A/D converter is directly representative of the true rms value of the ac input signal. The dc output of the rms converter is also applied to the LINEAR ANALOG OUTPUT terminals on the rear panel of the 8922A, as well as the analog meter on the front panel of the 8922A.
- 3-9. The last analog circuit we discuss in this section is the power supply. This circuit provides three regulated power supplies (+5V, +15V and -15V) to operate the instrument.

3-10. Digital Circuitry

- 3-11. The digital circuitry comprises the A/D converter, the controller, and the display. Together these circuits develop a digital representation of the rms value of the input signal, produce the commands that set the range and function of the instrument, and finally display the input value.
- 3-12. The dc output of the rms converter is translated to a digital representation by the A/D converter. The digital

representation is processed by the controller to obtain a bcd output which is proportional to the selected display mode (VOLTS, dB, dBm, REL). The BCD output is decoded and applied to the display.

3-13. DETAILED BLOCK DIAGRAM DESCRIPTION

3-14. In the following paragraphs we discuss, in detail, the individual functions within the major areas of circuitry in the 8922A. Each major circuit area is detailed in Figure 3-2. The description for each circuit is keyed to a separate block diagram, or to the schematics in Section 8.

3-15. Signal Conditioner

3-16. The signal conditioner utilizes an input attenuator, two amplifiers (Amp A and B) and the intermediate attenuator. As shown in Figure 3-3, these circuits are used to scale the varying voltage levels applied to the instrument so that the input to the rms converter is always between 0.09V rms and 1V rms. The diagram in Figure 3-3, illustrates the configuration of the circuitry within the signal conditioner. The controller, through a range decoder network, issues commands which select the appropriate division factor in the attenuators and the correct multiplication factor for amplifier A. Table 3-1, lists each operating range and the corresponding division and multiplication factors for the attenuators and amplifier (note that amplifier B has a fixed gain of X21).

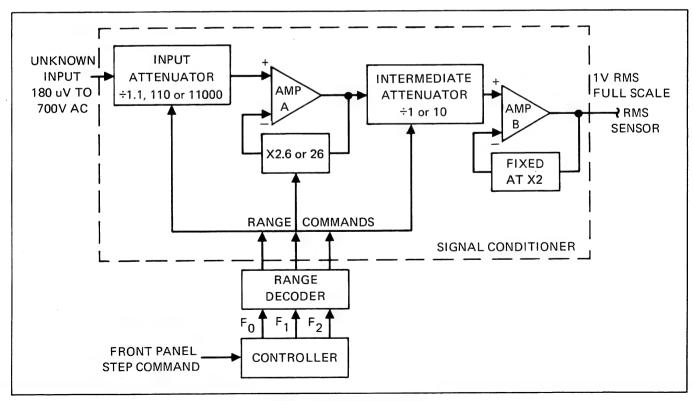

Figure 3-3. Signal Conditioner

Table 3-1.	Signal Cond	litioner Gain Configuration	
JT IATOR	AMP A	INTERMEDIATE	
MAIOR I			

RANGE	INPUT ATTENUATOR	AMP A	INTERMEDIATE ATTENUATOR	*CONDUCTING COMPONENTS
2 mV	÷1.1	X26	÷1	K1, Q6, Q28, Q32
20 mV	÷1.1	X2.6	÷1	K1, Q6, Q29, Q32, Q57
200 mV	÷1.1	X2.6	÷10	K1, Q6, Q29, Q31, Q57
2V	÷110	X2.6	÷1	K2, Q3, Q5, Q29, Q32, Q57
20V	÷110	X2.6	÷10	K2, Q3, Q5, Q29, Q31, Q57
200V	÷11,000	X2.6	÷1	K2, Q4, Q5, Q29, Q32, Q57
700V	÷11,000	X2.6	÷10	K2, Q4, Q5, Q29, Q31, Q57
*Ref	* Refer to the schematics in Section 8.			

The last column lists the component's FETs and relays, that conduct to establish gain configuration of the circuits (see the schematics for details on components).

3-17. **RMS Converter**

3-18. The 8922A uses a thermal rms converter circuit which supplies a dc output voltage proportional to the rms value of the ac input. The thermal sensor is a pair of resistor-transistor elements thermally isolated from each other and the case (see Figure 3-4). The ac input signal (Vac from amp B) produces a temperature change in the rms sensor's input resistor which is sensed by the associated transistor and causes a voltage change at the negative input of the integrator. Feedback, through the square root amplifier, provides a dc voltage to the rms sensor's output resistor so that a similar temperature rise occurs in the output resistor. The sensor gain is not constant with changes in input amplitude. These changes in gain are compensated for by the square root amplifier to maintain a constant response time for level changes.

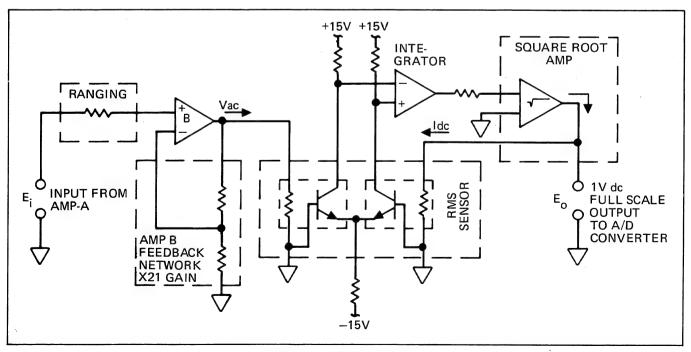

Figure 3-4. RMS Converter

3-19. The rms sensor is susceptible to damage from overvoltage inputs. During an overload condition, the protection circuit will clamp the output of Amplifier B to prevent damage to the sensor. Overload conditions would result during turn on, turn off, or any time the rms value of the applied input exceeds the operating range of the sensor.

3-20. A/D Converter

- 3-21. A dual-slope integration A/D conversion technique is used in the Model 8922A. This method applies the unknown voltage to a capacitor and allows the capacitor to charge for a specific time interval. At the end of this interval, the unknown voltage is removed (the charge on the capacitor at this time will be proportional to the level of the unknown voltage). Then a known voltage of opposite polarity is applied to the capacitor, and clock pulses are counted while the capacitor discharges. When the capacitor has reached its original charge point, the number of clock pulses counted is a digital construct of the analog voltage input to the A/D converter.
- 3-22. For the following discussion refer to Figure 3-5, the A/D Converter Simplified Schematic and Timing Diagram, and Figure 3-6, Controller Timing (A/D Converter).
- 3-23. At the beginning of the measurement cycle, INT goes high and the dc output of the rms sensor is applied to the A/D integrator for 100 msec. Capacitor, C203, charges up from the auto zero level at a rate proportional to the applied input voltage and the comparator's output, CM, is driven low. At the end of the 100 msec integrate period, DE (-) goes high, applying the reference voltage to the integrator. The integrator then discharges at a rate which is constant for all on scale inputs and the controller begins counting clock pulses. When C203 has discharged to the auto zero level, CM will go high, the controller will stop counting and the reading is displayed. This starts the auto zero period which allows the A/D converter circuitry to settle before the next cycle begins. If CM has not occurred before the end of the 200 msec maximum DE (-) period, the input will have exceeded the present range. In this case, the DE period will continue until either CM or the end of the 100 msec AZ1 occurs. When the AC + DC function is selected, all timing increase approximately 2.5 times.

3-24. Controller

3-25. The controller is a custom LSI that controls autoranging, the A/D converter, the display, and annunciators. In addition, the Controller can count in a

non-linear (dB) scale and display its count in dB units. A summarized description of each input and output pin used on the controller is give in Table 3-2 and shown in Figure 3-7.

3-26. AUTORANGING

3-27. Autoranging is the automatic selection of the instrument's range by the controller. With the low range enabled, the instrument may range through seven voltage ranges from 2 mV to 700V rms. Autoranging also applies in the dB modes but gives the effect of a single range spanning 132 dB. By coding the logic levels on the three lines, F0, F1, and F2, the controller selects a range (see Table 3-3, Output Range Codes) by setting up the circuit conditions of the input and intermediate attenuators and amplifier A that are necessary for signal conditioning in that range. (See Table 3-1, Signal Conditioner Gain Configuration.) If the controller senses that the input is above or below the selected range (see Table 3-4, Over/Underload Conditions), it shifts up or down one range (depending upon the direction sensed) and halves its cycle time. The controller blanks the display and determines whether the input to the instrument is now in range or if a further change in range is necessary. When the proper range is found, display blanking is removed and the cycle time returns to normal. Use of the HOLD RANGE control will command the Controller to remain at the present range (see Table 3-5, Input Range Codes) via command input line D, E, and F. A signal from the STEP UP RANGE control will increment the instrument one range.

3-28. COMPUTATIONS

3-29. The controller is able to count (compute) in two modes, linear or non-linear. The following paragraphs will explain how the controller obtains its linear (volts) or non-linear (dB) readings.

3-30. Voltage Computations

3-31. To make a voltage measurement the controller must linearly count clock pulses for a time determined by the A/D converter. Referring to Figure 3-7, you can see that when the dB/VOLTS switch is placed in its up (out) position the rate multiplier (RM) will be shunted and the main counter will count the number of clock pulses exactly as they occur (linear). As soon as the integrator in the A/D converter reaches the auto-zero point, CM will go high, commanding the main counter to stop counting and start shifting its count to the data latches. A count of clock pulses, in BCD format, that is proportional to the true rms value of the signal being measured. The BCD data is then shifted out of the controller, to a seven-segment decoder on four lines: W, X, Y and Z.

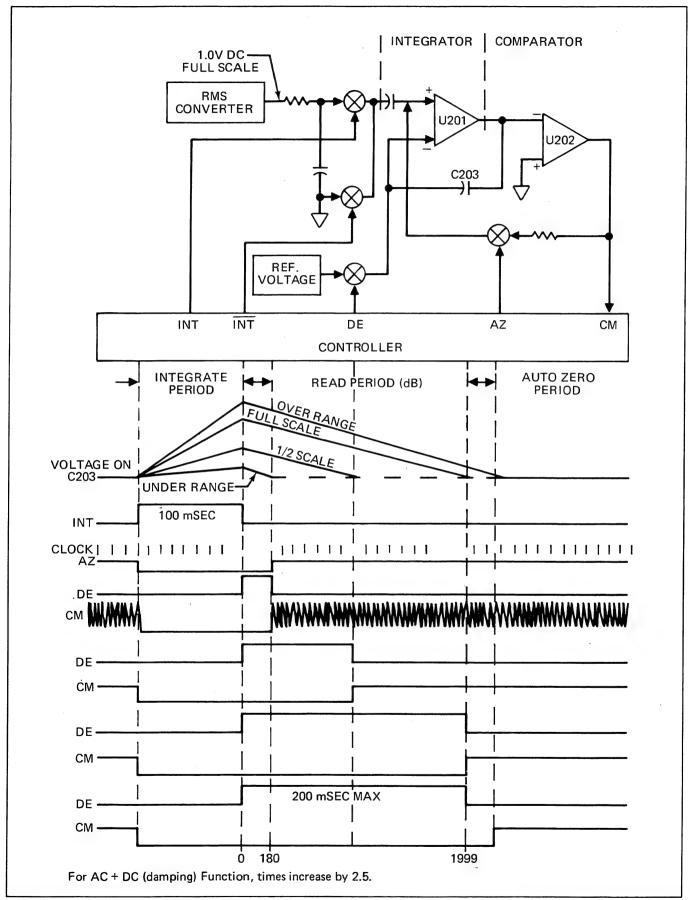

Figure 3-5. A/D Converter Simplified Schematic and Timing

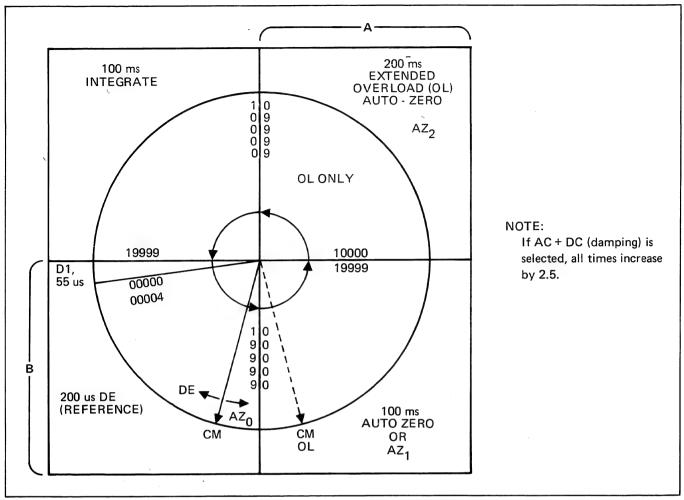

Figure 3-6. Controller Timing (A/D Converter)

Table 3-2. Controller Summary

INPUT/ OUTPUT	PIN #	PIN NAME	PIN DESCRIPTION
Input	1	V _{SS}	+5V supply
Input	2	СМ	Compare signal from A/D Converter.
Input	3	CL ₁	External Oscillator input.
Input	4	CL ₂	400 kHz crystal input for internal oscillator.
Output	5	RG	Negative going pulse in the middle of each strobe. Insures strobed data for DOU is valid.
Output	6-10, 12-14	ST ₀ -ST ₇	Eight strobes that indicate which LED is to be enabled and accept the data on lines W, X, Y and Z.
Input	11	RD	Impedance reference selection line, in dB.
Output	15-17	F ₀ -F ₂	Encoded range lines, $F_0 = MSB$, $F_2 = LSB$, code equals range $\# + 1$, voltage swings from; -15 to $0V$.
Input	18	β	Strobe input on this pin determines the lower range limit.
Input	19	а	Strobe input on this pin determines the upper range limit.
Output	20	DP	Enables display decimal point.
Input	21	V _{DD}	Ground, 0V supply.

Table 3-2. Controller Summary (cont)

INPUT/ OUTPUT	PIN #	PIN NAME	PIN DESCRIPTION
Output	22	BZ	Indicates new data is ready for DOU, occurs after CM, one strobe raster long.
Input	23-25	F, E & D	Enables controller ranging, see Table 3-5.
Output	26-29	W, X, Y & Z	BCD data, W = MSB, Z = LSB, TTL compatible.
Output	30	BLK	Drives blanking input on display decoder driver, TTL compatible.
Input	31	K	700V range overload enable.
Input	32	V _G G	-15V supply.
Input	33	J	Enables 3½ or 4½ digit display in linear mode and determines (in combination with RD) the fixed reference in dB mode.
Input	34	Т1	Test (not used).
Input	35	dB	Enables dB display mode.
Output	36	INT	Enables not integrate period of A/D Converter.
Output	37	INT	Enables integrate period of A/D Converter.
Output	38	AZ	Enables auto zero period of A/D Converter.
Output	39	DE (-R)	Enables integrate reference period for positive input of A/D Converter.
Output	40	DE (+R)	Enables integrate reference period for negative input of A/D Converter (not used).

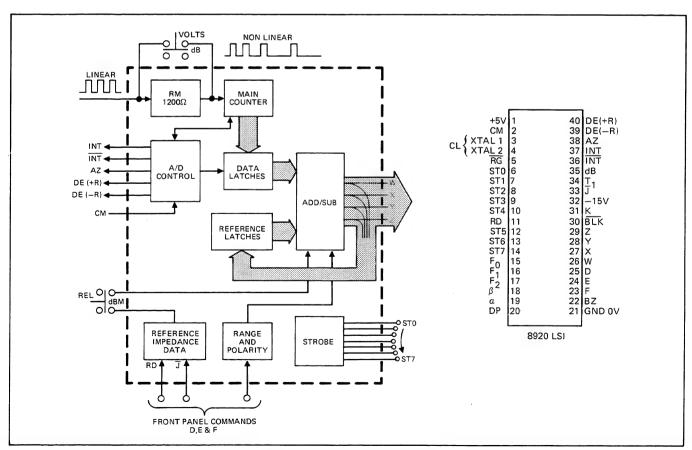

Figure 3-7. Controller Functions

Table 3-3. Output Range Codes

RANGE	DATA LINES		
MANGE	F ₀	F ₁	F ₂
2 mV	0	0	1
20 mV	0	1	0
200 mV	0	1	1
2V	1	0	0
20V	1	0	1
200V	1	1	0
700V	1	1	1
		,	

Table 3-4. Over/Underload Conditions

	LINEAR	dB*
Overload:	>1999 β	25.30 (20V range)
except for 700 700V range:	>700 a	56.10
Underload:	<180	4.30 (20V range)
minimum input for accurate dB conversion	132	1.60 (20V range)

*dB calculations are based on a 1200 ohm reference impedance and 20V range. The calculation is then corrected for the proper range and the selected impedance by the addition of the appropriate constant, which may be calculated from the following equation:

20 log $\sqrt{1.2-20}$ log $\sqrt{0.001R}$ + N (20). Where N = number of ranges above or below the 20V range, i.e., 2 mV range N = X4

Table 3-5. Input Range Codes

COMMAND LINES		INES	8922A CONTROLLER
D	E	F	FUNCTION
0	0	1	Auto range fast range cycle
1	0	0	Hold present range (overridden by $a \otimes \beta$)
1	1	0	Range up at CM time (over- ridden $a \& \beta$)

3-32. dB Computations

3-33. If the dB/VOLTS switch is in the dB position, a non-linear count of the clock pulses is enabled. The binary rate multiplier (RM) passes only a fraction of the clock pulses on to the controller's main counter (see the illustrated input to the main counter on Figure 3-7). This count approximates the logarithmic curve of the dB scale and, like the VOLTS mode, is stored in the data latches.

3-34. dBm Reference

3-35. Don't let the m confuse you, it simply means that the power level, as measured in "dB Computations", is referenced to 1 mW. In other words, when the instrument reads 0 dB the system being measured will be dissipating 1 mW of power. The following will explain how the controller obtains a measurement of power referenced to 1 mW (dBm).

3-36. In order for the controller to obtain a measurement in dBm, the appropriate reference impedance must be used. A 1200 ohm reference impedance is assumed by the RM. Therefore, if any other reference is desired an appropriate constant must be added or subtracted from the count. The dBm REFERENCE rotary switch connects one of the eight strobes to RD and J. The controller responds by sending the appropriate constant to its ADD/SUB.

3-37. Referring to Figure 3-7, let's assume that a 600 ohm reference impedance is selected and the instrument has previously made a relative measurement. Strobe zero will be applied to RD until the REL/dBm switch is placed in its dBm position. At this time strobe 4 (corresponding to 600 ohms) is applied to RD and causes the controller to select the 600 ohm reference impedance data. This data along with the range and polarity data is then shifted to the ADD/SUB where it is combined with the count referenced to 1200 ohms. The resultant value is now equivalent to a dBm reading referenced to 600 ohms. The range and polarity data is held in the reference latches until RD or J detect a strobe change or unless the instrument is turned off. (Switching to the VOLTS mode will not cause the data in the reference latches to be lost.)

3-38. Relative (REL) Reference

3-39. Relative reference measurements allow any voltage input to become the 0 dB point to which all subsequent voltage inputs are referenced. The controller makes a relative reference computation much the same way it made a dBm computation. However, in the REL mode, 0 dB no longer refers exclusively to 1 mW. The following explains how the controller makes a relative reference measurement.

3-40. Referring the Figure 3-7, you can see that upon selection of the REL mode, the reference impedance data line will be disabled. However, to make a relative

reference measurement the controller must use an initial reading, and to obtain an initial reading it must use a reference impedance. Therefore, before the REL mode can be selected the controller must be allowed to make at least one complete measurement while in the dBm mode. Once the measurement has been completed the REL mode may be selected. The reading will now be fed back to the reference latches and held. The controller will subtract the reading in the reference latches from all subsequent readings. Note that if the instrument is ranged up/down, 20 dB will be added to or subtracted from the reading held in the reference latches. The reading held in the reference latches, however, will be lost any time the instrument is turned off or if the REL switch is released.

3-41. Display and Annunciators

3-42. The computed value of the input to the instrument is transmitted serially as four-bit BCD characters on the W, X, Y, and Z data lines from the controller to the sevensegment-decoder, see Figure 3-8, Display and Annunciators. The output of the seven-segment-decoder drives the Display Data Bus, which is common to the inputs of all five of the display LEDs. Strobe pulses from the controller determine which display LED is enabled to accept the data on the Display Data Bus. ST4 through ST7 strobes the seven-segment LEDs from LSD to MSD. respectively. ST0 gates the ± 1 digit. If the volts display mode is selected, 3½ digits will be enabled resulting in a resolution of 0.05%. If the dB display mode is selected, 41/2 digits will be enabled and the resolution will be 0.01 dB. The decimal point is enabled separately by the DP line from the controller.

3-43. the annunciators, excepting the UNCAL, are strobed on by ST0 which is routed through two circuits. One path is completed when the dB/VOLTS switch is in the dB position. The dB annunciator DS309 is enabled. If the REL/dBm control is in the REL position, RELATIVE REFERENCE annunciator, DS308, will also be enabled. If the dB/VOLTS switch is in the VOLTS position, ST0 is routed through another path and either the V annunciator, DS307, or the mV annunciator, DS306, is enabled depending upon the current range of the instrument.

3-44. Power Supply

- 3-45. The power supply section on the Main PCB provides the instrument with operating voltages of +15V, -15V, and +5V.
- 3-46. Line voltage (100V, 120V, 220V or 240V, as selected by switches S209 and S210) is connected to the primary of the main power transformer, T200 via POWER switch, S208, and fuse, F1. the secondary of T200 contains two windings. One winding drives the ± 5 V power supply, the other drives the ± 15 V power supply.
- 3-47 In the +5V power supply, power from the secondary winding is full-wave rectified by CR205, filtered by C211, and regulated by VR203.
- 3-48. In the $\pm 15V$ power supply, power from the secondary winding is full-wave rectified by CR204, filtered by C209 and C210, and regulated to +15V by VR202. The -15V is regulated by U211 and Q207.

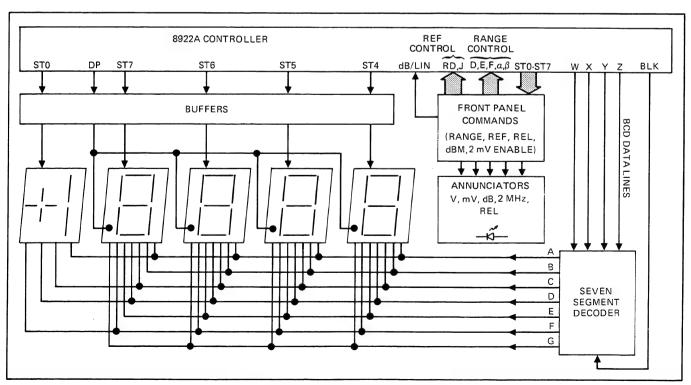

Figure 3-8. Display and Annunciators

Section 4

Maintenance

WARNING

THESE SERVICING INSTRUCTIONS ARE FOR USE BY QUALIFIED PERSONNEL ONLY. TO AVOID ELECTRIC SHOCK, DO NOT PERFORM ANY SERVICING OTHER THAN THAT CONTAINED IN THE OPERATING INSTRUCTIONS UNLESS YOU ARE QUALIFIED TO DO SO.

4-1. INTRODUCTION

4-2. This section of the manual contains maintenance information for the Model 8922A True RMS Voltmeter. The material is presented under the categories of shipping information, general maintenance, performance test, calibration adjustments, and troubleshooting. The performance test is recommended as an acceptance check when the instrument is first received and as performance verification test at regular intervals. Table 4-1 lists the test equipment required to calibrate your 8922A. If the recommended equipment is not available, you may substitute equivalent equipment that meets the required characteristics.

4-3. SERVICE INFORMATION

- 4-4. The 8922A is warranted for a period of 1 year upon delivery to the original purchaser. The warranty is located on the back of the title page.
- 4-5. Factory authorized calibration and service for your 8922A is available at various locations throughout the world. A complete list of these factory authorized service centers is included in Section 7. If requested, an estimate will be provided to you before work is begun on an instrument that is beyond the warranty period.

4-6. GENERAL MAINTENANCE

4-7. Access Information

4-8. To gain access to the interior of the instrument, remove the four screws located on the bottom of the case. The top cover can now be removed.

4-9. INPUT POWER SELECTION

- 4-10. The 8922A may be operated from any one of the line voltages shown in Table 4-2. Use the following procedure to prepare the instrument for use with the local line power.
 - 1. Disconnect the instrument from the line power and remove its top cover (four screws on the bottom of the unit hold the top cover in place).
 - 2. Set switches, S209 and S210, to the positions indicated in Table 4-2 for the desired line voltage.
 - 3. Install the top cover and connect the unit to line power.

Table 4-1. Recommended Test Equipment

	220V, 50-400 Hz	
	240V, 50-400 Hz (250V, MAX)	

4-11. Cleaning

CAUTION

Do not use aromatic hydrocarbons or chlorinated solvents for cleaning. These solutions will react with the plastic materials of the instrument.

4-12. Clean the front panel and case with denatured alcohol or a mild solution of detergent and water. Clean dust from the interior of the instrument with dry, low pressure air (20 psi). Contaminants can be washed from the circuit board with demineralized water and a soft brush (avoid getting excessive amounts of water on the switches).

4-13. Fuse Replacement

4-14. The 8922A has one replaceable fuse located on the rear panel which may be replaced with a 1/8 amp, slo-blo fuse (Metric uses 5x20 mm, 1/8 amp slow acting).

4-15. PERFORMANCE TEST

NOTE

In the following procedures the instrument (8922A) which is being either checked or calibrated is referred to as the UUT (Unit Under Test).

4-16. The following paragraphs comprise a performance verification test which compares the instrument's performance to the specifications given in

Section 1 of this manual. The test is recommended as an acceptance test when the instrument is first received and later as a calibration procedure to verify instrument accuracy at the scheduled calibration periods (90-days). It can also be used as an aid in troubleshooting. Test equipment required for the performance test is listed in Table 4-1. If the recommended test equipment is not available, equivalent test equipment may be substituted. To insure optimum results, the test must be performed at an ambient temperature between 18 and 28 degrees Celsius with a relative humidity of 80%. Allow the instrument to warmup at least 30 minutes, with the case cover in place, before attempting the performance test.

4-17. If the instrument fails to meet the performance test limits, calibration adjustment, troubleshooting, and/or repairs are indicated. Procedures for calibration adjustments and troubleshooting are given later in this section of this manual.

NOTE

In all of the procedures in this section, precautions should be taken to minimize ground currents, stray fields, etc.

4-18. Low and Midband Performance Check (Volts Display Mode)

4-19. This procedure will verify that the UUT's low and midband performance is within the limits specified in Section 1. Set up the test equipment as shown in Figure 4-1, and select the required function and input signal as indicated in Table 4-3. Note any deviation between the UUT performance and the specified limits.

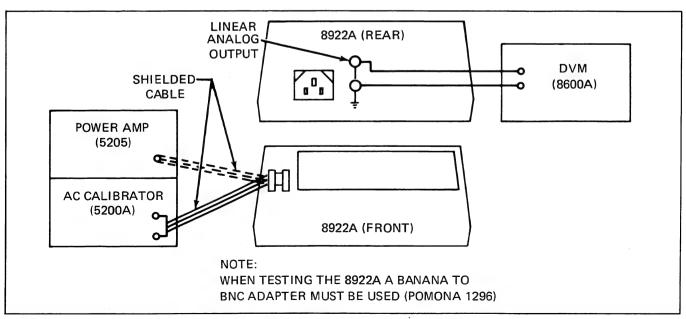

Figure 4-1. Low and Midband Performance Test Set-Up

Table 4-3. Low and Midband Performance Checks (Volts Display Mode)

FUNCTION			PUT	I	LIMITS	Volts Display Mode)
MODE	RANGE	LEVEL	F(Hz)	DISPLAY	or COUNTS	COMMENTS
AC, AUTORANGE	2 mV	1.9 mV	500	1.000	±38	Note that the mV annunciator is lit.
AC, AUTORANGE	20 mV	10 mV	500	10.00	±10	Note that the mV annunciator is lit.
AC, AUTORANGE	200 mV	100 mV	500	100.0	±5	Note that the mV annunciator remains lit.
AC, HOLD	2V	3V	500	1.999		Verify that display flashes 1.999 signifying overrange.
AC, HOLD	2V	1V	500		±.01V	Measure 1V on the linear analog output. Note that the test instrument's reading is within ±.01V of UUT's displayed reading.
AC, HOLD	2V	.2V	500		±.002V	Measure 0.2V on linear analog output. Note that the test instrument's reading is within ±.002V of UUT's displayed reading.
AC, HOLD	2V	.17V	500	.17		Verify that decimal flashes signifying below 9% of range.
AC, AUTORANGE	2V	1V	500	1.000	±5	Note that the V annunciator is lit.
AC, AUTORANGE	20V	10V	500	10.00	±5	Note that the V annunciator remains lit.
AC, AUTORANGE	200V	100V	500	100.0	±5	Note that the V annunciator remains lit.
AC, AUTORANGE	20 mV	10 mV	50K	10.00	±10	Note that the UUT autoranges down to the 20 mV range.

AC, AUTORANGE	200V	100V	50K	100.0	±5	
AC, AUTORANGE	700V	600V	500	600	±3	Use the 5205A for this test.
AC, AUTORANGE	2V	1V	2 Hz	1.000		Use rms voltmeter and function generator.

4-20. dB Display Mode Check

4-21. This procedure will verify that the UUT's dB display mode is functioning properly. Set up the test equipment as shown in Figure 4-1. Depress the RANGE HOLD switch and step up to the 2V range. Select the 1V range on the AC calibrator and adjust its output for 1.000 on the UUT's display. Select the dB display mode and switch through the dBm REFERENCE selection switch, checking the reading at each position against Table 4-4. The readings should not differ by more than ± 1 digit from the numbers given in Table 4-4.

4-22. DC Low Level Check

REL

REL

4-23. This procedure will verify correct operation with low level DC inputs. Set up the test equipment as shown in Figure 4-2, and select the required function, range and input signal as indicated in Table 4-5. Note any deviation between the display of the UUT and the specified limits.

4-24. AC Low Level Check

- 4-25. This procedure will verify that the UUT's low level AC performance meets the specifications of Section 1. Set up the test equipment as shown in Figure 4-3 and complete the AC Low Level Calibration procedure, but replace steps 2-d and 2-e with the following:
 - d. Note that the UUT's display reads the same error as noted in step 1-f ±38 digits.
 - e. Note that the UUT's display reads 0.1900 ± 4 digits.

4-26. High Frequency Response Check

4-27. This procedure will verify that the UUT's high frequency response meets the specifications of Section 1. Set up the test equipment as shown in Figure 4-4, and select the required input amplitude and frequency as indicated in Table 4-6. Note any discrepancies between the display reading and the limits given.

REFERENCE DISPLAY MODE SOURCE COMMENTS OHM READING dBm 50 1.000 Note that the dB annunciator is lit. +13.00 dBm 75 1.000 +11.24 dBm 93 1.000 +10.31 dBm 110 1.000 +9.58 dBm 124 1.000 +9.06 dBm 135 1.000 +8.69 dBm 150 1.000 +8.23 300 1.000 dBm +5.22 dBm 600 1.000 +2.21 dBm 900 1.000 + .45 1000 dBm 1.000 -.01dBm 1200 1.000 - .80 Note that the dB and REL annunciators

AC, AUTORANGE	200 mV	170 mV	50K	170.0		Adjust the SG503 amplitude so the display reads 170.0.
AC, AUTORANGE	200 mV	170 mV	11M	170.0	±85	Readjust the input frequency without changing the amplitude.
AC, AUTORANGE	2V	1.7	50K	1.700		Adjust the SG503 amplitude so the display reads 1.700.
AC, AUTORANGE	2V	1.7	11M	1.700	±85	Readjust the input frequency without changing the amplitude.

4-28. CALIBRATION ADJUSTMENTS

- 4-29. The calibration adjustment procedures given in the following paragraphs should be performed after repair of the 8922A and/or when the instrument fails the performance test requirements. If the instrument will not respond to or meet the limits of the adjustment procedures, troubleshooting and repair is indicated. Equipment required for the calibration adjustment is listed in Table 4-1.
- 4-30. All calibration adjustments are accessible when the top case cover is removed from the instrument. Figure

- 4-5 identifies the location of assemblies, test points, and adjustments that must be accessed to complete the calibration adjustment procedures.
- 4-31. To ensure optimum results, the calibration adjustments must be performed at an ambient temperature of 18 to 28 degrees Celsius with a relative humidity of less than 80%. Allow the instrument to warmup (with the top case cover in place) for at least 60-minutes before starting the calibration adjustment procedures.

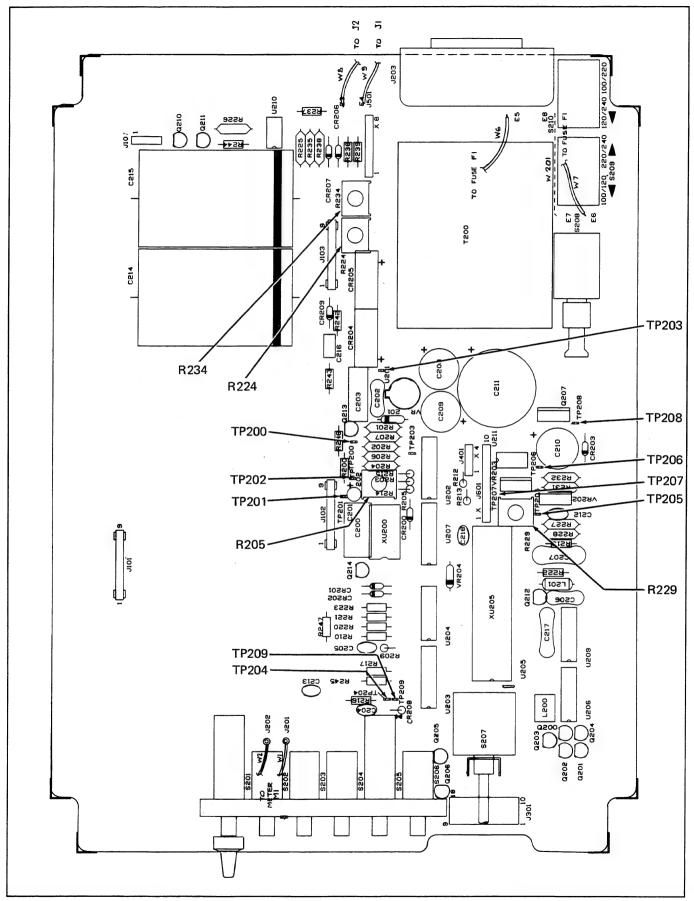

Figure 4-5. Calibration Adjustments and Test Point Locations

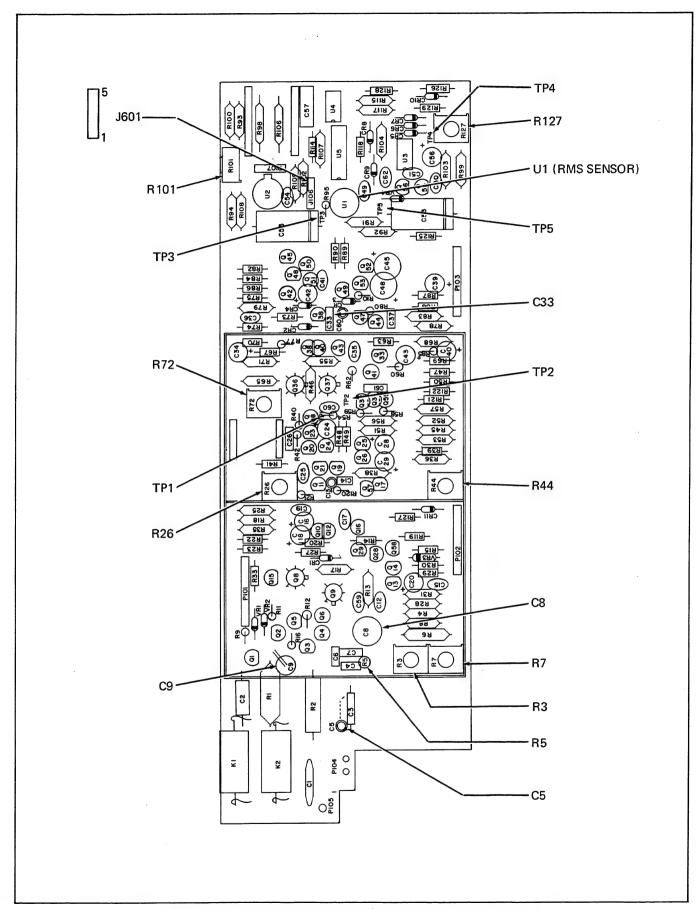

Figure 4-5. Calibration Adjustments and Test Point Locations (cont)

4-32. Power Supply Calibration Adjustment

WARNING

IN ALL PROCEDURES WITH THE TOP COVER REMOVED THE OPERATOR SHOULD BE AWARE THAT THE FOLLOW-ING POINTS ARE AT LINE POTENTIAL:

- 1. POWER LINE CONNECTOR.
- 2. ALL LAND PATTERNS NEAR POWER TRANSFORMER.
- 3. POWER SWITCH.
- 4. FUSE HOLDER.
- 4-33. Use the following procedure to calibrate the power supplies of the UUT.
 - 1. Place all front panel switches to the out position.

CAUTION

Certain overload protection depends on the supply voltages. To avoid possibility of damage, DO NOT adjust the $\pm 15 \text{V}$ supplies with the UUT in overrange.

- Monitor TP206 with a DVM using TP205 as a voltmeter common.
- 3. Adjust R229 for $\pm 15V \pm 0.1V$ on TP206.
- 4. Check TP208 for $-15V \pm 0.2V$.
- 5. If TP208 does not comply, recheck TP206 and adjust R229, if necessary.
- 6. Check TP207 for $+5V \pm 0.25V$.

4-34. Low and Midband Accuracy Adjustment

- 4-35. Use the following procedure to calibrate the low and midband accuracy of the UUT:
 - 1. Place all the front panel switches in the out position.
 - 2. Short TP204 to TP209 to light the 4th display digit.
 - 3. Apply the input voltages and frequencies as listed in Table 4-7, and adjust to the limits given. If any limit cannot be reached, see Troubleshooting.

Table 4-7. Low and Midband Accuracy Adjustments

STEP	INPUT V	RANGE (AC)	FREQ Hz	ADJUST	READ DISPLAY	LIMIT ± of READING
1	1	2V (AC)	500	-	Note reading.	n/a

20	the UNCAL	Apply 22.0 mV at 500 Hz to the input of the UUT. Increase the input voltage in .1 mV steps until the UNCAL annunciator lights. Verify that this occurs with an input voltage between 22.5 and 23.5 mV. If the reading is outside these limits, refer to the "RMS Protection Circuit Calibration".						
		. ~						

4-36. Linear Analog Output

- 4-37. Use the following procedure to calibrate the 8922A linear analog output.
 - 1. Set up the calibration test equipment as shown in Figure 4-6.
 - 2. Select AC and AUTORANGE.
 - 3. Apply 1.000V, 500 Hz to the input and monitor the dc voltage at the rear panel linear analog output (LAO). Adjust R224 for the same reading as the display ± 2 mV.

- 4. Observe that the null/peak meter reads center of scale $\pm \frac{1}{2}$ division.
- 5. Push RANGE HOLD and decrease the input to 0.1V, 500 Hz. The output voltage should read the same as the front panel display ± 0.2 mV. If it is not within this limit, adjust R234 and go back to step 3.
- 6. Increase the input to 0.5V. The voltage at the output should be the same as the front panel display ± 0.001 V.

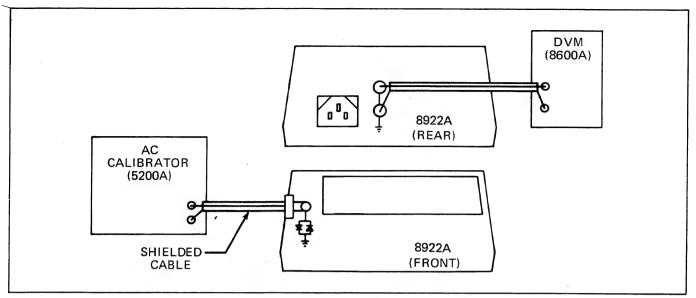

Figure 4-6. Linear Analog Output Check

4-38. AC Low Level Calibration and Filter Check

- 4-39. Use the following procedure to calibrate the UUT's AC low level performance.
 - 1. Measure the 503 Attenuator Errors (leveled generator).
 - a. Place all front panel switches out.
 - b. Set up the test equipment as shown in Figure 4-3.
 - c. Set the leveled generator to 50 kHz, X1 and connect the 874-20 dB-GR attenuator input to the input of the UUT.
 - d. Adjust the leveled generator amplitude until a steady reading of 1.000V is obtained on the display of the UUT.
 - e. Switch the leveled generator to the X.1 setting, observe that the UUT autoranges down to the 100 mV range and note the reading error.
 - f. Switch the leveled generator to the X.01 setting and note that the reading error is less than 10 digits on the 20 mV range.

2. Calibrate the 2 mV range:

- a. Connect the 50 ohm terminated attenuator output to the input of the UUT.
- b Switch the leveled generator to the X1 and adjust the amplitude such that a steady reading of 10.00 mV is obtained on the UUT.
- c. Switch the leveled generator to the X.1 setting, allowing the UUT to range down to the 2 mV range.

- d. Adjust R44 so that the display of the UUT reads the same error as noted in step 1-e. ± 1 digit.
- e. Depress the RANGE HOLD switch, readjust the leveled generator for a reading of 1.800 ± 1 digit and switch down to the X.01 setting. The UUT's display reading should be from 0.180 to 0.186 after settling.

3. Filter check:

- a. Set the generator to X1 and adjust output amplitude for a display of 18.00 mV.
- b. On the front panel of the UUT, set the FILTER switch to the in position.
- c. Verify that the UUT display is between 17.70 and 17.20 mV.
- d. On the front panel of the UUT, set the FILTER switch to the out position.
- e. Set the generator to X.1 and adjust the output amplitude for a display of 1.800 mV.
- f. On the front panel of the UUT, set the FILTER switch to the in position.
- g. Verify that the UUT display is between 1.770 and 1.720 mV.
- h. Adjust the generator output amplitude for a UUT display of 1.800 mV.
- i. Set the generator to X.01.
- j. Verify that the UUT display is now between .180 and .182 mV.

4-40. High Frequency Calibration

- 4-41. Use the following procedure to calibrate the UUT's high frequency response:
 - 1. For the ranges shown in Table 4-8, adjust the amplitude of the leveled generator at 50 kHz to establish a reference (refer to Figure 4-7, for the test
- setup). Use one 20 dB attenuator for 0.1V, two attenuators for 0.01V, and three attenuators for .001V terminated with 50 ohms. Take care not to overdrive the transfer standard.
- 2. Note the reading at the output of the A55 transfer standard and maintain this by readjusting the generator's level for other frequencies.

Table 4-8. High Frequency Calibration

STEP	SOURCE LEVEL	UUT RANGE	SOURCE FREQ.	ADJUST	UUT DISPLAY	LIMIT ± COUNTS
1	.001	2 mV	50K	source	1.000	±1

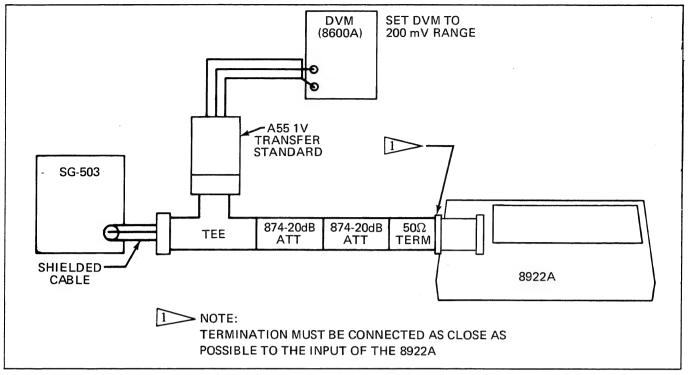

Figure 4-7. High Frequency Calibration

4-42. RMS Protection Circuit Calibration

CAUTION

Resistor, R111, controls the protection circuit for the rms sensor. DO NOT make any adjustments to R111 other than those listed below. Indiscriminate adjustments may cause component damage.

4-43. Use the following procedure to calibrate the protection circuit of the rms sensor. This procedure should be completed only if the rms sensor has been replaced or if the limit in step 20 of Table 4-9, cannot be met.

NOTE

The ambient temperature must be 23° C ± 5 ° C and the ± 15 V supplies must be calibrated.

- 1. Remove the tape dot on R111 and turn R111 to its maximum CCW position.
- 2. Select AC, AUTORANGE then HOLD and STEP UP (as necessary) to lock the UUT in the 20 mV range. Refer to Figure 4-5 for the calibration and test point locations. Monitor the voltage at TP4

with a DVM and apply 24.0 mV, 200 Hz to the input. Observe that the UNCAL annunciator lights up.

- 3. Turn R111 slowly clockwise until the DVM reading stops decreasing. The UNCAL annunciator should go out. Turn R111 slightly clockwise so that the UNCAL annunciator remains unlit but lights when the input voltage is increased to 24.1 mV. Increase the input voltage to 25.0 mV and note the voltage on TP4. Apply an input signal of 250 mV at 2 kHz. The voltage at TP4 should not change by more than 20 mV.
- 4. Replace the tape dot on R111 or use Glyptol.

4-44. TROUBLESHOOTING

4-45. This section contains information selected to assist in troubleshooting the Model 8922A. Before attempting to troubleshoot the instrument, verify that the trouble is actually in the instrument and is not caused by faulty external equipment or improper control settings. For this reason, the Performance Check is suggested as a first step in troubleshooting. The Performance Check may also help to localize the trouble to a particular section of the instrument. If the Performance Check fails to localize the trouble, the following information may be helpful. Location of principal circuitry areas, test points, and adjustment locations of the Model 8922A are shown in Figure 4-5.

Table 4-9. 8922A Troubleshooting Procedure

STEP NO.	INSTRUCTION	YES	NO	GO TO
1	All front panel switches should be in the out position.			2
2	Connect the UUT (8922A) to appropriate line power and observe the display.		3	
3	Does display light correctly?	4	11	
4	Apply 1V ac input to UUT, select AC function, VOLTS display mode and AUTORANGE.			5
5	Does UUT respond to input?	6	17	
6	Does UUT pass the Low-Midband Check?	7	25	·
7	Does UUT pass the Low Level DC Check?	8	26	
8	Does UUT pass the High Frequency Response Check?	9	28	
9	UUT operating properly.			10
10	Apply 1V ac to UUT in the 2V ac range.			17
11	Check appropriate display drivers, Q200-Q204.	12	23	
12	Correct power supply test point voltages are as follows: TP206 = $+15V$; TP207 = $-5V$; TP205 = power supply ground.			13
13	Is TP206 at +15V?	14	29	
14	Is TP208 at -15V?	15	31	•
15	Is TP207 at +5V?	16	32	
16	Power supply is operating properly.			10
17	Check voltage between TP201 and TP202.			18
18	Is the voltage 0.5V, ±10%?	19	33	
19	Does null/peak meter read approximately ½ scale?	20	40	
20	Check A/D Converter, is it operating correctly?	24	21	
21	Check TP200, is it at +6.4V?	22	42	
22	Check the following for appropriate A/D Converter waveforms: U200-U202, U205 and TP203. Refer to Figure 4-8.			23
23	Replace defective component.			24
24	Repeat Performance Tests and Calibration.			1
25	Check attenuator logic levels using Table 4-10.	10	23	
26	Are S1 and Q33 switching properly?	27	23	
27	Check Amp A & B.			10
28	Check Amp A & B and attenuator network.			10
29	Remove AC PCB, is TP206 at +15V now?	30	43	
25		"	73	

Table 4-9. 8922A Troubleshooting Procedure (cont)

STEP NO.	INSTRUCTION	YES	NO	go то
30	Troubleshoot AC pcb assembly.			23
31	Remove AC pcb, is TP208 at -15V?	30	44	
32	Check: VR203, U200-U202, U205, U206, U209, U210, U211, U4 and U302.			23
33	Check TP3.			34
34	is voltage on TP3 at 0.5V $\pm 10\%$?	35	45	
35	Turn UUT off, disconnect UUT from line power.			36
	CAUTION			
	To avoid damage to the RMS sensor, steps 37 and 38 must be performed with a multimeter whose output on the ohms function is no greater than 10 mA.			
37	Is the resistance of U1-6 to U1-7 (or J106-2 to J106-3) 90 ohms $\pm 8\%$. (Out of circuit resistance = 100 ohms $\pm 8\%$.)	38	50	1
38	Is the resistance of U1-8 to U1-9 (J106-4 to J106-3) = 100 ohms $\pm 8\%$.	39	50	
39	Check U2, U4 and U5.			23
40	Check test point E3, is it at +1V ±5%?	41	51	
41	Check meter and U210B.		*	23
42	Check VR201.			23
43	Check VR202.			23
44	Check U203 through U207.			23
45	Check TP1			46
46	Is TP1 at 0.045V ±10%?	47	52	
47	Check TP2.			48
48	Is voltage on TP2 at 0.045V ±10%?	49	54	
49	Check Amp B. Refer to the AC Amplifier schematic for voltage check points.			23
50	Replace rms sensor, refer to RMS Sensor Replacement Procedure.			1
51	Check U201A.			23
52	Check Q3, Q4, Q5 and Q6 (refer to Table 4-10) are they switching properly?	53	23	
53	Check Amp A. Refer to the AC Amplifier schematic for voltage check points.			23
54	Check Q31, Q32 and Q33.			23

Table 4-10. Attenuator Logic States

- 4-46. When troubleshooting the UUT, the following points should be kept in mind:
 - 1. Before any troubleshooting is begun, make a visual inspection of the interior of the instrument.
 - 2. When troubleshooting the AC amplifiers, isolate the DVM test lead with a 10 k Ω probe, otherwise capacitive loading may cause the AC Amplifiers to oscillate.
 - 3. MOS type integrated circuits can be damaged by discharging static electricity through the device. All circuits of this type are designated on the schematic with this symbol \otimes . Use care and always use a grounded soldering iron when removing or installing MOS devices.
- 4-47. A troubleshooting guide for the 8922A is presented in Table 4-9. This guide is in a tabular flow chart form and is recommended for use in isolating a problem to a functional circuit area. The initial steps in the troubleshooting guide refer to the Performance Check made earlier in this section.

4-48. RMS Sensor Replacement

- 4-49. Use the following procedure when replacing the rms sensor. This procedure should be completed if the troubleshooting procedure indicates that the rms sensor must be replaced, refer to Figure 4-5.
 - 1. Carefully unsolder the defective sensor from the AC PCB using a grounded soldering iron.
 - 2. Install the new sensor (be sure that the sensor spacer pad is in place) and replace the AC Assembly and shield.

- 3. Remove R97 or R105, if installed, and replace with the bus wire from the sensor kit.
- 4. Remove R96 and R110, if installed, and replace R123 and R124 with 20.5k resistors.
- 5. Plug the protection diode fixture into J106. Note that the fixture is symmetrical.
- 6. Turn R111 to its maximum counterclockwise position.
- 7. Place all of the front panel switches to their out position and apply power to the instrument.
- 8. Select AC + DC, RANGE HOLD, and up range to the 2V range. Monitor TP3 with a DVM, connect a DC calibrator to the input (refer to Figure 4-6) and apply +1.8V dc. The sensor input should now be clamped by the protection circuit and TP3 should read about half the display reading.
- 9. Turn R111 slowly clockwise and observe that the DVM and instrument display readings increase. The dc voltage at TP3 should stop increasing at around +0.8 to +1.0V. The instrument display should stop increasing around 1.5 to 1.99V, the point at which the protection diodes clamp the input. DO NOT ALLOW THE INSTRUMENT TO GO INTO OVERLOAD. Return R111 to its CCW stop and repeat the procedure with a negative dc input. Turn R111 CCW until TP3 reads about -.5V and remove the calibrator and the protection diode fixture.

- 10. Short the input, select AC, RANGE HOLD, and step up range to the 2V range. Monitor TP3 and adjust R72 for 0 ± 1 mV dc.
- 11. Select AC + DC and adjust R26 for 0 ± 1 mV dc on TP3.
- 12. Go to the rms protection circuit calibration procedure, "RMS Protection Circuit", and complete the steps as listed. Return to step 13 below.
- 13. Perform calibration steps 1 through 1c, as listed in Table 4-6, Low and Midband Adjustments. Should R101 not have enough adjustment range, substitute one of the kit resistors ($15 \,\mathrm{k}\Omega$, $30.1 \,\mathrm{k}\Omega$, or $45.3 \,\mathrm{k}\Omega$) for R105 if reading is too high, R97 if reading is too low or zero.
- 14. Monitor the ac voltage at TP5* with a DVM and apply 100 mV, 10 Hz to the input with the instrument in the 200 mV range.
- 15. If the monitored ac voltage is 70.0 mV or greater, install the 402 k Ω resistors for R96 and R110.**
- 16. If the monitored ac voltage is still 70.0 mV or greater, install the 158 k Ω resistors for R96 and R110.**
- 17. Push the AC + DC/AC switch to the in position and apply 100 mV at 2 Hz to the input.
- 18. If the monitored voltage is 70 mV (100 mV peak) or greater, replace R123 and R124 with 17.1 $k\Omega$ metal film resistors.
- 19. If the monitored voltage is until greater than 70 mV (100 mV peak), then replace R123 and R124 with 13.7 k Ω resistors.
- 20. If the UUT is operating correctly, repeat the entire CALIBRATION procedure, otherwise return to beginning of Table 4-9.

4-50. A/D Calibration Resistor Selection

4-51. This procedure is used to determine the correct A/D selected resistor, R204, and should be completed whenever VR201 is replaced or when R205 does not have enough range to calibrate the A/D. All possible values for R204, listed in Table 4-11, may be obtained in a set by ordering Part #490722.

NOTE

The UUT may go into overrange with R204 removed.

- 1. Place all front panel switches in the out position and set R205 to the center of its adjustment range.
- 2. Apply 100.0 mV, 200 Hz to the input and select resistors R204 from Table 4-11, until the display reads closest to 100.0 mV.
- 3. Verify that R205 has adjustment range on both sides of the displayed 100.0 mV reading.
- 4. Perform the instrument calibration.

Table 4-11. R204 Resistive Values (mf ±1%, 1/8W)

VALUE	VALUE
71.5K	39.2K
66.5K	33.2K
61.9K	26.7K
56.2K	20.5K
51.1K	14.0K
43.3K	7.15K

4-52. DC Offset Resistor Selection

4-53. Use this procedure to determine the correct DC offset selected resistors, R19 or R34 for amplifier A, and/or R66 or R76 for amplifier B. Use the procedure when the amplifier offset cannot be adjusted to 0V with R26 and/or R72; usually because one or more of the following have been replaced:

Amplifier A Q9, Q8, Q10, and Q12. Amplifier B Q36, Q37, Q38, and Q40.

All possible values for R19 or R34 (amplifier A) or R66 or R76 (amplifier B), listed in Table 4-12, may be obtained in a set by ordering Part #490730. Two sets will be necessary if both amplifiers require the same selected resistor value.

Table 4-12. R19/R34, R66/R76 Resistive Values (mf, ±1%, 1/8W)

VALUE	VALUE
449K	32.4K
332K	31.6K
169K	30.1K
115K	28.0K
86.6K	26.1K
68.1K	24.3K
57.6K	22.6K
48.7K	21.5K
43.2K	20.5K
38.3K	19.1K
34.8K	

4-54. SET UP

- 1. Remove the cover shield of the AC Converter PCB.
- 2. Connect a short jumper between input low and the metal fence on the AC Converter PCB.

4-55. AMPLIFIER B

(must be done before amplifier A)

- 1. Apply power, short the input, select AC, RANGE HOLD, and step up to the 2V range.
- 2. Set R72 to the center of its adjustment range and monitor TP3 with a DVM.
- 3. Select resistors from Table 4-12, starting with the highest value until the DVM reads closest to 0

volts dc. Place the resistor in the socket for R66 if the DVM reads positive, R76 if the reading is negative. Adjust R72 for a DVM reading of less than 1 mV dc at TP3.

4-56. AMPLIFIER A

- 1. Select AC + DC, set R26 to the center of its adjustment range and monitor TP3 with a DVM.
- 2. Select resistors from Table 4-12, starting with the highest value until the DVM reads closest to 0 volts dc. Place the resistor in the socket for R19 if the DVM reads positive, R34 if the reading is negative.
- 3. Adjust R26 for a DVM reading of less the 1 mV dc at TP3.
- 4. Perform the complete instrument calibration.

5-1 INTRODUCTION

- 5-2. This section contains an illustrated parts breakdown of the instrument. A similar parts listing for each of the Options will be found in Section 6. Components are listed alphanumerically by assembly. Both electrical and mechanical components are listed by reference designation. Each listed part is shown in an accompanying illustration.
- 5-3. Parts lists include the following information:
 - 1. Reference Designation.
 - 2. Description of each part.
 - 3. FLUKE Stock Number.
 - 4. Federal Supply Code for Manufacturers. (See Section 7 for Code-to-Name list.)
 - 5. Manufacturer's Part Number.
 - 6. Total Quantity per assembly or component.
 - 7. Recommended Quantity: This entry indicates the recommended number of spare parts necessary to support one to five instruments for a period of two years. This list presumes an availability of common electronic parts at the maintenance site. For maintenance for one year or more at an isolated site, it is recommended that at least one of each assembly in the instrument be stocked. In the case of optional subassemblies, plug-ins, etc., that are not always part of the instrument, or are deviations

from the basic instrument model, the REC QTY column lists the recommended quantity of the item in that particular assembly.

5-4. HOW TO OBTAIN PARTS

- 5-5. Components may be ordered directly from the manufacturer by using the manufacturer's part number, or from the John Fluke Mfg. Co., Inc. factory or authorized representative by using the FLUKE STOCK NUMBER. In the event the part you order has been replaced by a new or improved part, the replacement will be accompanied by an explanatory note and installation instructions if necessary.
- 5-6. To ensure prompt and efficient handling of your order, include the following information.
 - 1. Quantity.
 - 2. FLUKE Stock Number.
 - 3. Description.
 - 4. Reference Designation.
 - 5. Printed Circuit Board Part Number.
 - 6. Instrument Model and Serial Number.

CAUTION

Indicated devices are subject to damage by static discharge.

- IF ANY ONE OF THE FOUR MATCHED XSTRS ARE DAMAGED ALL FOUR WILL HAVE TO BE REPLACED AND THE DC OFF-SET RESISTORS FOR AMP-A AND AMP-B WILL HAVE TO BE RESELECTED. THERE-FORE, IT WILL BE NECESSARY TO ORDER TWO RESISTOR SETS. SEE SECT. 4 "DC OFFSET RESISTOR SELECTION".
- 2 IF THIS PART IS REPLACED, THE DC
 OFFSET RESISTOR FOR THE CORRESPONDING AMPLIFIER (AMP-A, AMP-B) MAY
 HAVE TO BE RESELECTED. SEE SECT. 4
 "DC OFFSET RESISTOR SELECTION".
 (Q9 AND R17, Q37 AND R46) MATCHED
 PAIRED SETS, PART NUMBER 476700.
- 3 Q1, AND Q2, XSTR MUST BE COLOR MATCHED.

6-1. INTRODUCTION

6-2. This section of the manual contains information concerning the options and accessories available for use with the Model 8922A. This section consists of an introductory section, an accessories subsection and a series of option subsections. All options and accessories are listed by model or option number in the table of contents included in this section.

6-3. ACCESSORIES

6-4. Hardware type accessories, i.e., rack mounting kits and cables, are documented in the accessories subsection. While option numbers (-003, -004) are documented as

individual subsections. Each subsection contains all of the information necessary to install, operate and maintain each option and accessory. This includes a list of replaceable parts and a schematic (when applicable).

6-5. OPTIONS

6-6. The location of a particular subsection is facilitated by the use of unique page and paragraph numbering which corresponds to the option or accessory in question. For example, a 600-X series identifies the general accessories subsection and a 604-X series identifies the subsection for the -004 Option (where X is the individual page or paragraph number).

Accessories

600-1. RACK MOUNTING KITS

600-2. Kits are available that allow your DVM to be mounted either in a standard 19-inch equipment rack or panels with DIN size openings. The Y2014 allows one instrument to be offset-mounted on the right side in a 19-inch equipment rack (Figure 600-1). The Y2015 allows

two instruments to be mounted side-by-side in a 19-inch equipment rack (Figure 600-2). The Y2020 allows one instrument to be panel mounted in a DIN size opening. With the appropriate mounting kit installed, you can easily remove your DVM for portable operation and easily mount the DVM back in the permanent installation.

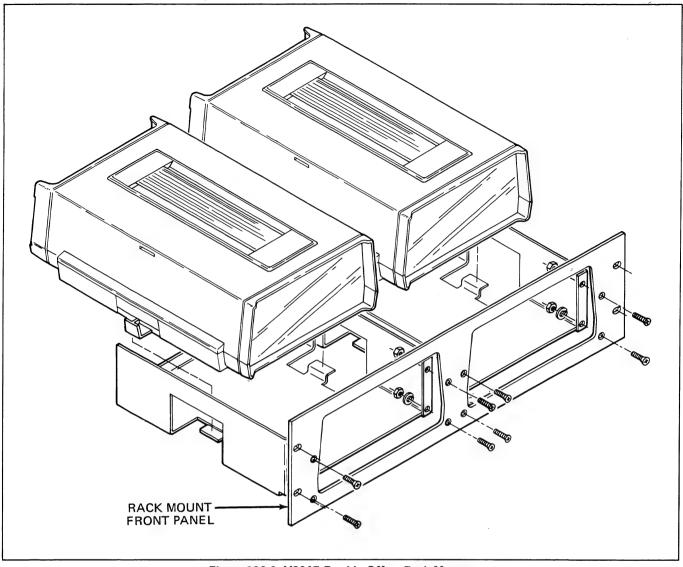

Figure 600-2. Y2015 Double Offset Rack Mount

-003 Option Counter Output

603-1. INTRODUCTION

603-2. The -003 Counter Output Option converts an rms input signal into an isolated 100 mV peak, squarewave suitable for triggering a counter. There are several advantages as opposed to using separate inputs for the DVM and the counter. First, the 8922A autoranged input has a much greater dynamic range than a counter. This means that input sensitivity is increased to 180 µV while, on the other hand, DVM inputs as large as 700V rms will not overload the counter. In practice, inputs should be 1.8 mV or greater due to possible false triggering effects of noise riding on lower level inputs. Secondly, because the counter output is isolated, the diode isolation from earth ground is not defeated if the counter low input is earth ground. Third, only one probe is needed to make simultaneous voltage and frequency measurements.

603-3. SPECIFICATIONS

603-4. Specifications for the Counter Output Option are given in Section 1 of this manual.

603-5. INSTALLATION

- 603-6. Use the following procedure to install the Counter Output Option. Refer to Figure 603-1 for illustration.
 - 1. Remove 8922A top cover (see Access Information).
 - 2. Plug Counter Output Option into J106-1, J106-3 of the A2 AC PCB Assembly and mechanically

secure with the three screws provided; one on the AC Assy shield and two on the rear panel.

- 3. Connect the 3-wire cable (P401) to J401 on the A1 Main PCB Assembly.
- 4. Verify operation using the calibration procedure.
- 5. Replace the shields.

603-7. OPERATION

603-8. Once installed, the Counter Output Option requires no operator attention other than ensuring that no voltage is ever applied to the option's rear panel BNC output (J102).

603-9. THEORY OF OPERATION

603-10. As shown in Figure 603-2, the Counter Output Option utilizes an isolation amplifier, two Schmitt triggers, pulse transformer, and a DC-DC power supply to provide an isolated output suitable for triggering a counter. The isolation amp is used as a buffer between amplifier B's output and the first Schmitt trigger. The Schmitt trigger drives the pulse transformer with a square wave at the same frequency as the sine wave input. The pulse transformer provides isolation between the input common and output common. The second Schmitt trigger is used to convert the pulse transformer output to the 100 mV square wave output at the same frequency as the sine wave input. The DC-DC power supply provides isolated +5.3V and -6.5V for the second Schmitt trigger.

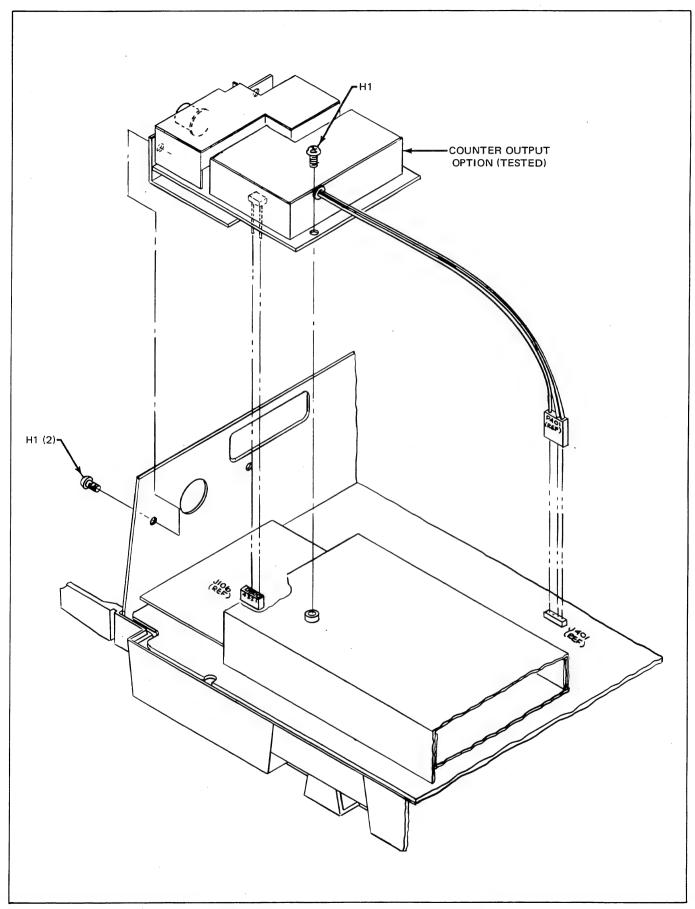

Figure 603-1. Counter Output Option Installation

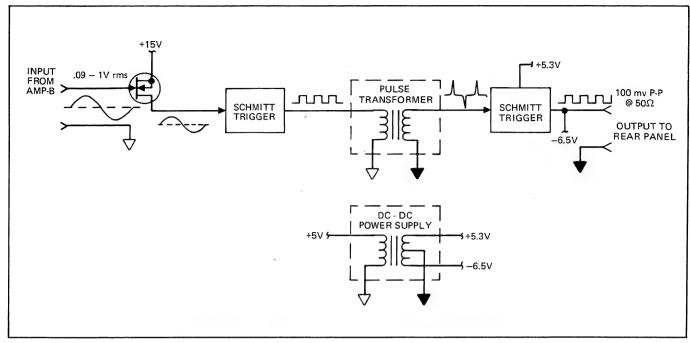

Figure 603-2. Counter Output Option Simplified Schematic

603-11. MAINTENANCE

603-12. The following maintenance information covers three areas; performance testing, calibration and troubleshooting of the -003 Counter Output Option. However, before any of these procedures can be started, the calibration of the mainframe instrument (8922A) must be successfully completed. The table of recommended test equipment in Section 4 lists all of the equipment necessary to calibrate, adjust, and troubleshoot the mainframe instrument. Any additional equipment required to check and calibrate the -003 Option is listed in Table 603-1. If you are unable to obtain the recommended test equipment, insure that the substitute has equal or better performance specifications.

NOTE

For the following procedures the 8922A will be referred to as the UUT (Unit Under Test).

Table 603-1. Recommended Test Equipment

QTY	EQUIPMENT NOMENCLATURE	REQUIREMENT	RECOMMENDED EQUIPMENT
1	Universal Counter Timer	100 Hz-20 MHz	Fluke 1953A
2	Oscilloscope	DC to 200 MHz 1.8 ns	Tektronix 475

603-13. Performance Test

- 603-14. The following procedure will verify that the Counter Output Option is operating within the specification limits stated in Section 1.
 - 1. Connect the AC calibrator, UUT, oscilloscope and termination as shown in Figure 603-3.
 - 2. Set the AC calibrator to its 10V range, set the UUT to AC FUNCTION, VOLTS DISPLAY MODE, and 2V range, HOLD and set the oscilloscope's time base to 0.2 sec/div and Vert on 50 mV/div.
 - 3. Referring the Table 603-2, change input to UUT as indicated, and note that display values are within indicated tolerances.
 - 4. Disassemble the setup as shown in Figure 603-3, and connect the SG503, UUT, and Universal Counter-Timer and terminations, as shown in Figure 603-4.
 - 5. Set the SG503 to its 10-25 MHz range, set the Universal Counter-Timer for frequency ratio measurement with 10 sec gate interval, and the UUT set to AC FUNCTION, VOLTS DISPLAY MODE, and 200 MV RANGE HOLD.
 - 6. Referring to Table 603-3, change input to UUT as indicated, and note that display values are within indicated tolerances.

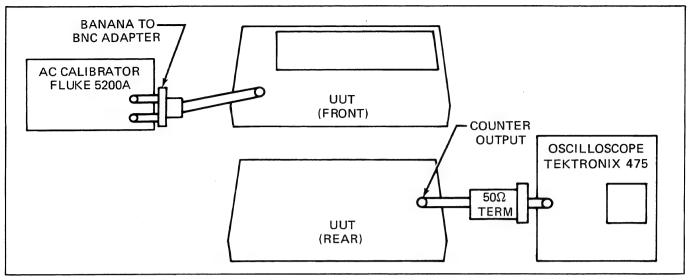

Figure 603-3. Counter Output Performance Set-Up

Table 603-2. Counter Output Amplitude

AC CAL- IBRATOR OUTPUT	UUT DISPLAY	OSCILLOSCOPE DISPLAY ±20%	COMMENTS
1.9V, 1 kHz	1.900	Observe 100 mV squarewave	Adjust calibrator output to obtain UUT display.
0.18V, 1 kHz	.180	Observe 100 mV squarewave	Adjust calibrator output to obtain UUT display.

Table 603-3. Counter Output Frequency Response

SG503 OUTPUT	UUT DISPLAY	COUNTER-TIMER DISPLAY ±1 DIGIT	COMMENTS
18 mV, 20 MHz	18.0	1.00000	Adjust the SG503 output to obtain UUT display.
180 mV, 20 MHz	180.0	1.00000	Adjust the SG503 output to obtain UUT display.

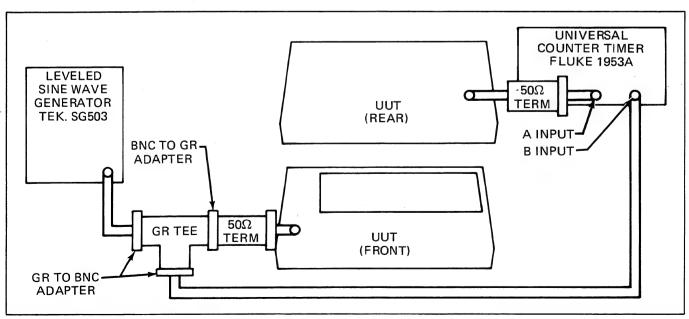

Figure 603-4. Counter Output Performance Test Set-Up

603-15. CALIBRATION ADJUSTMENT

- 603-16. The Counter Output Option should be adjusted when it is first installed or if the limits, as stated in the performance test, cannot be met. Use the following procedure to calibrate the Counter Output Option. If it is not possible to obtain the limits as stated in the following procedure, then the option will require troubleshooting. If, however, the limits are met, then we recommend that the performance test be completed as a check.
 - 1. Remove the UUT's top cover and measure the inverter power supply voltages:

MEASURE BETWEEN DVM DISPLAY

C413 and Ground 5.0V, ± 0.3 V C414 and Ground -6.2V, ± 0.3 V

- 2. Connect the AC calibrator, UUT, oscilloscope, and terminations as shown in Figure 603-3.
- 3. Set the AC calibrator to its 1V range at $10 \, \text{kHz}$, set the oscilloscope time base to $20 \, \mu \text{sec/div.}$ and Vert to 50 mV/div. and set the UUT to AC FUNCTION, VOLTS DISPLAY MODE, and 2V range HOLD.
- 4. Apply 180 mV/10 kHz from the AC calibrator to the input of the UUT. Using the oscilloscope check the UUT's counter output and adjust R404

- until a symmetrical square wave is obtained. The amplitude of the square wave should be 100 mV peak, $\pm 20\%$ and must not change as the input to the UUT is increased up to 18V.
- 5. Disassemble the set up as shown in Figure 603-3 and connect the SG503, UUT, Universal Counter-Timer, and terminations as shown in Figure 603-5.
- 6. Set the SG503 to its 11 MHz range, set the Counter-Timer for frequency ratio measurement with a 10 sec gate time and set the UUT to AC FUNCTION, VOLTS DISPLAY MODE, and 200 mV range HOLD.
- 7. Select an 11 MHz output on the SG503 and adjust its amplitude with the vernier control until the UUT reads 18.0 mV. At this point, the Counter-Timer should display a stable reading of 01.00000 ± 1 digit.
- 8. Reduce the output amplitude of the SG503 until the Counter-Timer display limit of step 7 cannot be met.
- 9. Adjust R404 until the Counter-Timer display limit of step 7 is met.
- 10. Repeat steps 8 and 9 until the Counter-Timer display limit can be met at the lowest possible input level.

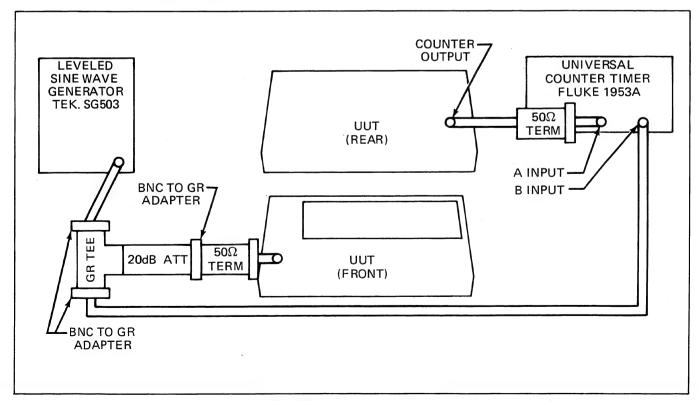

Figure 603-5. Calibration Set-Up

603-17. TROUBLESHOOTING

603-18. Table 603-4 should be completed ONLY if the performance test and calibration procedure indicate the the -003 Counter Output Option IS NOT operating correctly. This table includes voltage levels and waveforms of a properly functioning -003 Option. If you are unable to obtain any value ($\pm 15\%$) then you should replace the defective component and repeat the entire troubleshooting procedure. However, if all values are

obtained then the performance test and calibration procedure must be repeated.

603-19. LIST OF REPLACEABLE PARTS

603-20. A list of replaceable parts for the Counter Output Option is given in Table 603-5 and shown in Figure 603-6. Refer to Section 5 of this manual for ordering information.

Table 603-4. Counter Output Option Troubleshooting

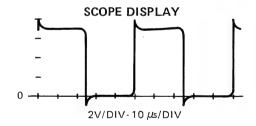

1. Using the 8020A or any compatible 3 1/2 digit meter, measure the following supply voltages.

SUPPLY VOLTAGE	MEASURE BETWEEN HIGH TERMINAL AND LOW TERMINAL	DVM DISPLAY (8020A)
+15	U401-1 and Input Common*	+15.00, ±0.1V
–15	U401-6 and Input Common*	-15.00 ±0.2V
+5	T402-2 and Input Common*	+5.00 ±0.25V
+5.3	U401-1 and Chassis Ground*	+5.3 ±0.3V
-6.5	U401-6 and Chassis Ground*	−6.5 ±0.3V

2. Using an oscilloscope (with x10 probe) Tek 475 or equivalent, check the following points for the indicated waveforms.

MEASURE BETWEEN HIGH TERMINAL - LOW TERMINAL

T402-1 and Input Common*
T402-3 and Input Common*

T402-6 and Input Common*

T402-8 and Input Common*

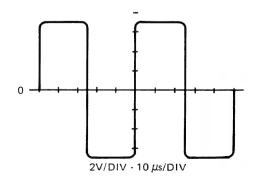

Table 603-4. Counter Output Option Troubleshooting (cont)

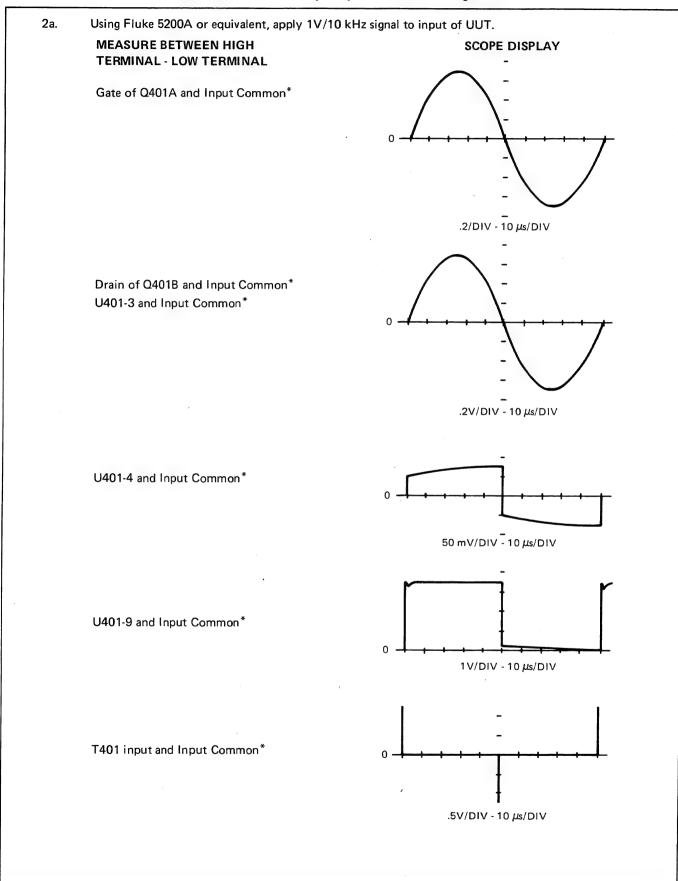

Table 603-4. Counter Output Option Troubleshooting (cont) MEASURE BETWEEN HIGH SCOPE DISPLAY **TERMINAL-LOW TERMINAL** T401 output and Chassis Ground* .5V/DIV - 10 \(\mu\)s/DIV U402-4 and Chassis Ground* .5V/DIV - 10 \(\mu\)s/DIV U402-9 and Chassis Ground* 2V/DIV - 10 μs/DIV J402 and Chassis Ground* 100 mV/DIV - 10 μs/DIV *Input Common = ∇ see schematic at end of this manual, Section 8.

- 5. Press the 8922A dB/VOLTS switch to the dB position then the REL/dBm switch to the REL position. The 8922A display will be ±0.00 dB.
- 6. Select the 20 volt range on the DVM.
- 7. Use the decade switch on the ac source to increase the 8922A input to the levels indicated in Table 604-1. Nore the DVM and 8922A displays to be within the tolerances given.

-004 Option Logarithmic Analog Output

604-1. INTRODUCTION

604-2. The Logarithmic Analog Output Option provides a non-isolated output voltage which varies continuously as the logarithm of the rms input. Scaling is: 0V dc output corresponds to 0 dB which is 200 μ V rms input to the 8922A while 13.1V dc output = 131 dB = 700V rms input. A continuous frequency response of circuits with a wide dynamic output is easily plotted on an XY recorder using this option. The option's output is non-isolated.

604-3. SPECIFICATIONS

604-4. Specifications for the Logarithmic Analog Output Option are given in Section 1 of this manual.

604-5. INSTALLATION

- 604-6. Install the option as follows, referring to Figure 604-1.
 - 1. Remove the top cover (see Access Procedures).
 - 2. Remove the plate located at the top of the 8922A's rear panel.
 - 3. Install the banana jack plate with the red banana jack to the right (when viewing the 8922A from the rear).
 - 4. Secure the Logarithmic Analog Output Assembly to the top of the transformer bracket (see Figure 604-1) using the two screws provided.
 - 5. Plug P501 into J501 (located on the Main PCB Assembly).

- 6. Solder the Logarithmic Analog Output Assembly's red output lead to the red banana jack, and the black lead to the black banana jack.
- 7. Verify operation using the calibration procedure presented in Section 4 of this manual.

604-5. OPERATION

604-6. Once installed, the Logarithmic Analog Output Option requires no operator attention other than ensuring that no voltage is ever applied to the option's output banana jacks.

604-7. THEORY OF OPERATION

- 604-8. The Logarithmic Analog Output Option, illustrated in Figure 604-2, utilizes the logarithmic characteristics of a P-N junction to develop an output proportional to the logarithm of the dc input from the thermal sensor.
- 604-9. The dc output voltage of the thermal sensor develops a collector current in one-half of a dual transistor. The resulting emitter base voltage is compared to the reference Vbe of the second half and scaled up accordingly. This voltage in turn develops a current which is summed with range information to produce the logarithmic output.
- 604-10. The output of the sensor covers one decade (.1 to 1V) in any one range. Scaling is such that one decade corresponds to 2V or 20 dB (.1V = 1 dB) at the output. "0" dB corresponds to 200 μ V and each range increase produces an additional 2V at the output. Transients during range changes are eliminated by a sample and hold circuit.

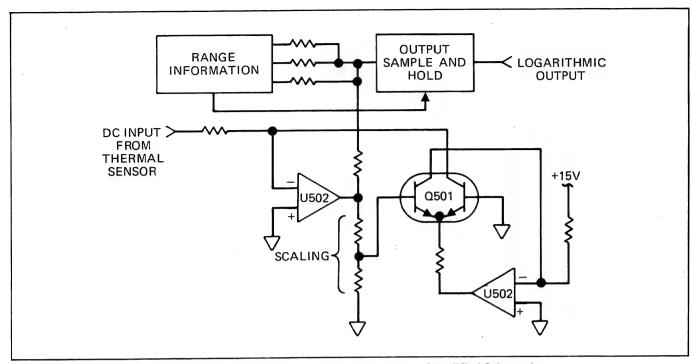

Figure 604-2. Logarithmic Analog Output Option Simplified Schematic

604-11. MAINTENANCE

604-12. The following maintenance information covers three areas; performance testing, calibration and troubleshooting of the -004 Logarithmic Analog Output Option. However, before any of these procedures can be started, the calibration of the mainframe instrument must be successfully completed. The table of recommended test equipment in Section 4 lists all of the equipment necessary to calibrate the mainframe instrument. No additional equipment is required to check, calibrate, and troubleshoot the -004 Option.

NOTE

For the following procedures, the 8922A will be referred to as the UUT (Unit Under Test).

604-13. PERFORMANCE TEST

- 604-14. The following procedure will verify that the Logarithmic Analog Output Option is operating within the specification limits stated in Section 1.
 - 1. Select the AC function, LO RANGE ENABLE, and AUTO range on the UUT.
 - 2. Apply $1.0\ mV$, $500\ Hz$ to the UUT INPUT connector.

- 3. Select the DC Volts function and 2 volt range on the DVM; connect it to the LOGARITHMIC ANALOG OUTPUT jacks on the rear panel of the UUT.
- 4. Adjust the vernier control on the AC source of a voltage reading on the DVM of $1.400 \pm .002V$ dc.
- 5. Press the UUT dB/VOLTS switch to the dB position then the REL/dBm switch to the REL position. The UUT display will be ± 0.00 dB.
- 6. Select the 20 volt range on the DVM.
- 7. Use the decade switch on the ac source to increase the 8922A input to the levels indicated in Table 604-1. Note the DVM and 8922A display to be within the tolerances given.

Table 604-1. Performance Test

	22224 21221 434	D) /84 D10D1 A)/*
8922A INPUT	8922A DISPLAY	DVM DISPLAY*
10 mV, 500 Hz	20.00 ±0.25 dB	3.4 ±0.24V
100 mV, 500 Hz	40.00 ±0.25 dB	5.4 ±0.24V
1V, 500 Hz	60.00 ±0.25 dB	7.4 ±0.24V
10V, 500 Hz	80.00 ±0.25 dB	9.4 ±0.24V
100V, 500 Hz	100.00 ±0.25 dB	11.4 ±0.24V

inaccuracie	s.	

604-15. CALIBRATION

604-16. The Logarithmic Analog Option should be calibrated when it is first installed or if the limits as stated in the performance test cannot be met. Use the following procedure to calibrate the Logarithmic Analog Option. If it is not possible to obtain the limits as stated in the following procedure then the option will require trouble-shooting. If, however, the limits are met then we recommend that the performance test be completed as a check.

- 1. Remove the 8922A's top cover, and set up the test equipment as shown in Figure 604-3.
- 2. Set the 8922A at AC, AUTO. Now apply 1.0 mV ac, 500 Hz. Observe the option's output to be approximately 1.4 \pm 0.2V dc. (TP504 is Ground, TP503 is the option's output.)
- 3. Apply 20.0 mV, 500 Hz to the UUT and select its HOLD RANGE. Monitor the voltage TP502 and adjust R501 for a 0 ± 0.0005 V dc on the DVM.
- 4. Monitor TP501 and note the magnitude and polarity of the offset from 0V to the nearest 0.01V.
- 5. While still monitoring TP501 adjust R512 for a reading of -10V +OFFSET of step 3 $\pm 0.01V$. Example:

Initial Offset	Final Reading
03V	$-1003 = 10.03 \pm .01 \text{V}$
+.14V	$-10 + .14 = -9.86 \pm .01$ V

- 6. Monitor TP503 and note the offset from +6.00V to the nearest 0.01V.
- 7. Decrease the input to 100 mV, 500 Hz and observe that the DMM reads $\pm 5.4V \pm 0.01V$ plus the offset noted in step 5.
- 8. Decrease the input to 20 mV, 500 Hz and observe that the DMM reads $\pm 4.00V \pm 0.01V$ plus the offset noted in step 5.

604-17. TROUBLESHOOTING

604-18. To troubleshoot the -004 Option read the theory of operation for this option and then check the actual voltage levels against those indicated on the -004 schematic, located in Section 8. If there are any descrepancies, simply replace the defective component and repeat the performance test and calibration procedure.

604-19. LIST OF REPLACEABLE PARTS

604-20. A list of replaceable parts for the Logarithmic Analog Output Option is given in Table 604-2 and shown in Figure 604-4. Refer to Section 5 of this manual for ordering information.

-521 Option DMM Digital Interface

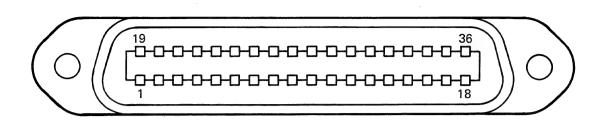

6521-1. INTRODUCTION

6521-2. The DMM Digital Interface provides optically isolated DMM data to a compatible external unit -- such as the DMM-1120A Interface PCB. (Note: The DMM Digital Interface connected to the DMM-1120A Interface PCB mounted in an 1120A Translator is the -529 Option.) Compatability requirements for the external unit are presented below. All additional information -- such as theory of operation, installation, operation, etc. -- is presented in supplemental documentation. If you order the DMM Digital Interface, either as an installed option or as a field installable kit, a copy of this manual will be provided. Order the 892XA-521K when ordering this option at the same time you order your 8922A. Order the 892XA-521 if you want a field installable kit.

6521-3. THE EXTERNAL UNIT

- 6521-4. The compatibility requirements for the external unit are listed below. Pin assignment on the interface cable is shown in Figure 6521-1. The cable connector type is a male 36-pin AMP "Blue Ribbon Type" series.
 - 1. The external unit must provide:
 - a. Operating Power: GND and +5V dc at 10 mA.

- b. DMM address: When reading DMM data the proper DMM address must be sent continuously on the A0 through A3 address lines. Resistive termination is $100 \text{ k}\Omega$ tied to +5V only. Logic high is 3.5 to 5.0V. Logic level low is 0 to 1.5V. Negative true logic.
- 2. The external unit must be able to accept:
 - a. Not Address Valid (AV): Signal line goes from logic high (3.5 to 5V) to a logic level low (0 to 1.0V) to indicate that the DMM has received the correct DMM address.
 - b. DMM data: BCD DMM data presented nibble serial 4-bit parallel on the W, X, Y, Z lines in the same sequence that data is presented to the DMM display. The format of this data is presented in Table 6521-1. The external unit must be capable of using the DMM data in this format. Logic high level is 4.6 to 5V at –0.14 mA. Logic level low is 0 to 0.7V at +0.36 mA.
 - c. Not Data Valid (DV): The external unit must accept data only when DV goes to a logic level low (0 to 1.0V) from a logic level high (3.5 to 5V). If the DMM is not autoranging and if the data is valid and new, then DV will go low in the middle of each data nibble to indicate to the external unit that this nibble is valid and settled.

DIN		SOURC	E	
PIN NO.	MNEMONIC	DMM	EXT UNIT	DESCRIPTION
1	ĀV	X		Not Address Valid - Low indicates DMM is responding to a valid address.
2	DV	×		Not Data Valid - Low indicates that DMM data on the W, X, Y, Z lines is valid, new and settled.
3	A0		X	LSB
4	A1		Х	DMM ADDRESS
5	A2		Х	
6	A3		X	MSB
7 & 8		NOT USED		
9	Z	X		LSB
10	Y	X		
11	X	X		BCD DMM data transmitted nibble serial.
12	w	X		MSB
13-16		NOT USED		
17	GND		X	Operating voltages for the interface side of the DMM Digital Interface PCB circuitry.
18	+5V		Х	
19-36		NOT USED	-

-519 Option DMM-IEEE-488 Interface

6529-1. INTRODUCTION

6529-2. The DMM-IEEE-488 Interface Translates between the 8922A and the General Purpose Interface Bus (GPIB) as defined by the IEEE 488-1978. The interface is composed of one DMM-1120A Interface PCB — mounted in and 1120A Translator — and one or more DMM Digital Interface(s) (-521K Option). The

interface implements the following IEEE functions: SH1, AH1, T3, TE3. All additional information is contained in supplemental literature. If you order the DMM-IEEE-488 Interface either as an installed option or as a field installable kit, a copy of this manual will be provided. Order the 892XA-529 when ordering this option at the same time you order your 8922A. Order 892X-A529 if you already have an 8922A and want a field installable kit.

Section 7

General Information

7-1. This section of the manual contains generalized user information as well as supplemental information to the List of Replaceable Parts contained in Section 5.

Appendix 7A Manual Change Information

INTRODUCTION

This appendix contains information necessary to backdate the manual to conform with earlier pcb configurations. To identify the configuration of the pcb's used in your instrument, refer to the revision letter (marked in ink) on the component side of each pcb assembly. Table 7A-1 defines the assembly revision levels documented in this manual.

NEWER INSTRUMENTS

As changes and improvements are made to the instrument, they are identified by incrementing the revision letter marked on the affected pcb assembly.

These changes are documented on a supplemental change/errata sheet which, when applicable, is inserted at the front of the manual.

OLDER INSTRUMENTS

To backdate this manual to conform with earlier assembly revision levels, perform the changes indicated in Table 7A-1.

CHANGES

There are no backdating changes at this printing. All pcb assemblies are documented at their original revision level.

Table 7A-1. Manual Status and Backdating Information

Ref Or	Assembly Name	Fluke Part																					
Option No.		No.	_	Α	В	С	D	Ε	F	G	Н	J	К	L	М	N	Р						
[*] A1	Main PCB Assembly	510594	x																				
A1A1	Display PCB Assembly	456921					x																
A2	AC PCB Assembly	510602	х																				
-003	Counter Output PCB Assembly	471672					x																
-004	Logarithmic Analog Output PCB Assembly	471680		х																			
																				-			
																			,
